WELCOME to dr_019, now that we have at least two members we can post!

Tell me about your self and your hobby interests.

73!

Bill

## 2. 5 members and growing!

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-06-11 19:25:55 UTC
From: Bill Leahy
Topic: 2  Message: 2

Hi and welcome to all our new "charter" members to TS-850 group!

It is my hope that this will become a forum for helping us more fully enjoy this fine rig.

With prices on eBay down in the 800's, it's a very affordable way to get to "state of the art" HFing, especially compared to the prices of the new rigs!

Please remember that the "only stupid question is the one that isn't asked", and that each member of the group has much valuable information and insight to share. Let's encourage each other to this end, regardless of our technical or writing abilities.

Let's get started with our posts and questions.

Everyone here is very busy, and we all have a lot of email to check. When replying to a message, please be sure to include just enough of the original message to establish the context of the issue; strip off the rest to save bandwidth and time. And, if you have issue with an individual that shouldn't go to the whole group, be sure to reply directly to them.

I have turned off file attachments to prevent spread of email trojans; if you need to share a file with someone, do it directly, or upload it to our "files" area in the Yahoo group home.

Please see our sister group, Amateur-repairs@... for more general questions regarding all Amateur Radio repair issues. Also you can check out our website, www.amateur-repairs.com, for more information on your list moderator.

73!

Bill and Bonnie Leahy

## 3. low voltage

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-06-28 09:52:53 UTC
From: Bill Leahy
Topic: 3  Message: 3

I have found that the '850 works all the way down to about 10.9 volts. then the CW sidetone starts to get a little wierd, and of course the power output is down somewhat. But overall I am pleased with it. We took ours out on it's 6th field day, and our RV battery charge system wasn't working... ended up running QRP and did just fine! Most everyone we called answered first shot.

## 4. 570 vs. 850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-07-23 16:21:33 UTC
From: n0pwz@amsat.org
Topic: 4  Message: 4

I'm confused.
Currently I'm going to be moving my FT-100 to the car and that leaves me without an HF radio in the house. The TS-570 and the TS-850 seem to be about the same price on the used market. Though the 850 is a really great radio, I'm wondering if it is a better buy than the 570. Opinions, pro or con, are appreciated!

Mark Stappenbeck

## 5. 570 vs. 850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-07-31 00:25:30 UTC
From: n0pwz@amsat.org
Topic: 4  Message: 5

It looks like I'm about ready to find out the difference between these two radios. I'm happy enough with the price, it was used, but I have a feeling that the 850 may make a better base radio than the 570. Does anyone have any pointers on getting along with the 850? Are there any peculiarities about this radio that one should be aware of in maintaining this radio?

I hope this group continues to grow as there seem to be quite a few of these 850's coming onto the used market now. Even guys like me can afford to mess with what promises to be a pretty neat radio.

Regards!
Mark

## 6. RE: [TS-850] 570 vs. 850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-07-31 03:06:11 UTC
From: Bill and Bonnie Leahy
Topic: 4  Message: 6

Have owned my 850 for about 5 years now. Great rig. The only ones that seem to sound better are the IC-751 with both narrow filters, and the FT-1000MP with the mechanical filters.

You will have some RFI issues with digital modes if you use AFSK, just be sure to use isolation transformers in the audio lines and you will be fine. The Rigblaster and Rigblaster NOMIC are good for this.

If you intend to run CW-full break in, you will need the sidetone mod that allows you to adjust the CW sidetone from the front panel, rather than from the bottom access cover of the rig. There are at least two versions of this mod; both require a service manual. We can do it at our shop for $45.00 plus $5.50 shipping if you need help with it.

There is a mod to allow the fan to run at full 12 volts, instead of through a dropping resistor, if you want to run full power RTTY or FM, it will help keep the innards cooler.

There is a mod to increase sensitivity on the BC band, as with all other rigs, Kenwood put in a 20 db pad in the RF filter for that band. Wish they would quit doing that. That's what the ATT is for!

I have run my 850 portable on very bad 12v supply (I am in the process of beefing up the always-inadequate 12v wiring in our "new" RV!)... It does great all the way down to 10 volts, gets a little squirrily on break in and VOX operation but just reduce power and you can stay on the air.

I also modified the rig so that the receiver comes through the tuner, that helps sensitivity on ten meters when using the G5RV antenna on field day. May also help reduce intermod from strong out-of-band sigs, not sure if it really does or not, have not experienced that prior to the mod.

I have blown my rig up twice, once with lightning and once with a Henry 2K amp that was miswired (went lookin' for neutral through the rig ground, blew up same components as the lightning, this time it took me only 90 minutes to fix!). Other minor problem is the gas tube arrestor that likes to blow every 3 months... found that the rx antenna input resistance was upwards of 50 kOhms, doesn't take much wind/rain static to build damaging voltages on my wire antennas with 50k ohm ckt! I solved this by paralleling a new gas tube with a pi-wound 1mH choke, and that solved the problem. Gas tube should still fire with lightning strike, choke keeps smaller charges from building.

Display on both rigs hard to see in sunlight, if you are planning outdoor activities it will be a problem for you, otherwise display is very pleasant.

Hope this helps.

## 7. Battery Replacement

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-09-12 18:46:01 UTC
From: mlavell1@rochester.rr.com
Topic: 7  Message: 7

The display on the TS-850 has gone dim and it appears to be going through a self-test sequence... continually. I am assuming that the problem is the internal battery.

I bought the the TS-850 new in March of 1994. It has very little transmitting time on it but a lot of listening time.

I have not taken anything apart yet. The manual suggested that the battery replacement be done by an "authorized KENWOOD service facility". I assume that Kenwood is trying to limit it's liability with a statement like that. Perhaps the battery is soldered into the circuit and Kenwood believes that soldering irons are alien to modern hams.

Anyhow, I thought that I would ask for advice BEFORE messing it up. Is the lithium battery readily available? Are there any viable substitutes? If it is soldered-in, do people install battery boxes? Their must be a wealth of information on this subject by now.

Thank you.

Mike, KF2WH

## 8. Re: [TS-850] Battery Replacement

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Bill Leahy KOZL
Topic: 7  Message: 8

This battery is a solder-in, and to put in a coin cell
socket may be an unacceptable mod. It won't look real
good in there. The batts should last 5-10 years.

If you need the kenwood part number let me know.

There is some potential for damage to the PCB traces
under the battery, I had a customer ground out a hot
trace and burn it up. Didn't take long to repair, it
was just a blem on the rig.

## 9. introduction

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-09-17 23:42:33 UTC
From: jkilgore@io.com
Topic: 9  Message: 9

I just joined the list and thought I would introduce myself. I've been a ham off and on since 1971, and have used a TS-850 as my main rig since 1994. I really like the 850, and I don't plan on getting rid of it for long time. I think it has one of the best receivers around. I use it with a Timewave DSP-59+, which is a great combination. I currently operate mostly PSK31 and some MFSK16 and Hellschreiber, but am going to dust off the key and see if I can remember CW soon.

73,
Jeff, KC1MK

I got the Kenwood 500-Hz 8.83-MHz IF CW filter (along with the Kenwood 1.8-kHz 8.83-MHz IF SSH filter) when I bought the 850 new back in 1994. I have been thinking of adding the INRAD 250-Hz 455-kHz IF CW filter and may do so soon. I haven't operated much CW for several years, but plan on doing so soon.

73,
Jeff, KC1MK

## 12. Re: [TS-850] introduction

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-09-19 05:35:38 UTC
From: Bill Leahy KOZL
Topic: 9  Message: 12

I would recommend getting either the matching K'wood 500 hz filter for the 455khz IF, or getting both the Inrad 8.83 and 455 filters of same bandwidth. Reason being, if the filters are matched bandwidth, the slope tuning will work properly and the shape factor is much improved when the cascaded filters have the same bandwidth.

I have been using the 500hz kenwood filters for years, and have found them to be just fine even under contesting conditions. I can narrow the bandwidth as much as I like with the slope tuning, and have a wider bandwidth when needed to reduce fatique and allow faster copy when conditions not so crowded. Also the 500hz filters work great for RTTY, they are not too narrow for that mode (this may or may not be a consideration for you).

For casual operation, you only need the one filter, I usually keep just one turned on.

Regards!

## 13. static damage

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-09-23 05:36:12 UTC
From: Bill Leahy
Topic: 13  Message: 13

The TS-850 is vulnerable to damage on the push-to-talk ("ss") line, which is externally available at the mic jack and at the back panel ACC connector.

On the SS line are three, DTC124EK surface mount, NPN compound transistors, any of which can "pull" the PTT line (normally 8vdc) to ground to cause the transmit mode to happen. These are in addition to the hard contact on the microphone PTT switch.

If a static charge of sufficient energy is coupled to the SS line from any source, it will cause any or all of these three devices to go "leaky", which will cause the PTT/SS line to go "low" and lock the radio in transmit mode.

Sources of such static are: Lightning, walking across carpet and grabbing the microphone, wind or precip-induced charge on antennas, and a nearby cat purring excessively (hi).

Repairing this situation is not trivial; it involves SMD soldering on both sides of the IF unit. Better to try to prevent the damage.

Touch the side of the radio to dissipate static energy before touching the microphone or any controls. You don't have to go for shiny metal; if you have enough charge built up to damage the rig, it will go right through the paint. And yes, this can even be a problem on a warm summer day! I have drawn 1/2" arcs in my car from simply sliding across the seat (Denver area, where the relative humidity can get down into the single digits).

Use a grounded antenna. Most wire antennas and verticals are not grounded; this with the 50k ohm input impedance at the antenna connector in receive, can allow huge voltages to develop with even moderate wind and rain action. One guy I know puts 1mH pie-wound chokes across all of his antenna connections. I opted to put one inside my rig, across the gas arrestor tube.

Make sure your gas spark arrestor tube is OK. To check, remove the top covers of the rig. Remove the cover over the filter unit, top center unit, behind the fan. Observe a small glass unit right next to the inside of the antenna connector; it should be clear, not hazy or grey or dark inside, and the element inside (looks like an un-marked resistor) should be all black with no line around the middle.

If the tube is bad, replace it with a new one; KDSA301LA from Pacific Coast Parts (Kenwood parts distributor). You don't have to remove the board, just clip the old one out, leave long enough leads to tack-solder in a new one. By the way, when you order these, get two. You

will be using several of these in the life of the rig!

Disconnect antenna and power leads to rig in case of thunderstorms. I have had many rigs come in with lightning damage, "but I had the antennas unhooked!"... the damage was on the PTT line leading to the mic, the audio amp circuit for the speaker, or on GROUND traces on internal PC boards! Lightning can come in via any path, not just antennas.

73

## 14. Smoked during transmit?

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Tom
Topic: 14  Message: 14

I was on 40 meters talking SSB when I smelled something electrical but nor sure where it was coming from - next thing I knew I was no longer transmitting. NO OUTPUT - NO CURRENT DRAW on trasmit. Something cooked somewhere. I was using a G5RV antenna which has about a 4:1 SWR on 40 but the tuner had a nice match 1.2 to 1 or so and I was getting full output. 20 minutes earlier, I had a 40 meter CW qso no problem. Any idea what could have caused something to burn up ??? Receiver still works fine - whatever happened was in the trasmit side of the rig. 73

Tom the PA on the 850 is pretty stout, I am surprised
at this. Be sure your power supply didn't go to 22
volts on ya!!!

There are some base bias resistors on the PA
transistors that may have failed, lift the filter unit
(top center of rig, inside) and do a visual on the PA
board. Look carefully at the low-value 1/2 watt
resistors that are around the finals.

Do you have a service manual yet? I advise ALL '850
owners to get a service manual. Even if you don't use
it, the guy you have fix yer rig may need to borrow it
to faciliate quicker repairs. And you can make notes
in it.

Topic: 16  Message: 16

Enter your vote today! A new poll has been created for the
TS-850 group:

Have you are are you experiencing RFI
or "distorted audio" on transmit on
your TS-850?

o Are you using digital modes?
o Are you using AFSK?
o Are you using mic input?
o Are you using a isolation device, such as a "rig blaster" or similar?
o If so, does it work?

To vote, please visit the following web page:

http://groups.yahoo.com/group/TS-850/polls

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups

HI, Group!

This is bud, N0IA [NOVEMBER ZERO INDIA ALPHA]- licensed 50 years ago next February in Parkersburg, WV while still in Junior HS.

My TS 850 runs a Winlink MBO 24/7 and has since September 1992 except for a two month period while we moved from Las Vegas to retire here in Central Florida four years ago.

Present project is putting together three vhf/uhf packet switches (FPAC) to support the Florida Packet network.

73,
bud N0IA

Don't ask how I got W5NML as my ID on Yahoo!!!!! I used to be W5NML a hundred years ago in Oklahoma and typed it in someplace on Yahoo several years ago and can't get rid of it!

Oh it's you! I kinda thought it was. Welcome!

Well to have a rig in nearly constant service since
1992... that is great! not too many ham rigs can
boast that kind of reliability! Of course, it's got a
good owner that feeds it good DC and keeps its
antennas in good shape, no doubt!

## 22. two FM bandwidths on TS-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-10-24 20:07:50 UTC
From: Bill Leahy
Topic: 22  Message: 22

I'll bet you guys didn't know this. I don't think it's in the owner's manual...

In FM mode, you can select either the 6kHz or the 12kHz filter for receiving bandwidth.

Did you know that also switches the TRANSMIT deviation limits? In 12 kHz position, you are running +/- 5kHz deviation on transmit, which is the "standard" narrow-band FM that we also run on VHF and UHF. This is used (and in the U. S. in only legal) above 29.0 Mhz. This is the position normally used on 29.600 and thereabouts for 10M FM mode.

When you switch to the 6kHz receiving filter, it drops the deviation to +/-2.5khz, for "narrow-narrow band" FM! This makes it LEGAL in the US to run FM on any phone band where SSB or AM is permitted! It takes roughly the same bandwidth as AM.

Point of interest, the narrow-narrow bandwidth is also the new commercial standard for U. S. commericial FM two-way. Interesting that the 850 is ready to roll on that mode (although you would need a converter).

so, some time when the bands aren't too crowded, get on with another 850 bud and try narrow-narrow FM on the low bands! I've tried it, and it's a kick. It seemed to generate less intentional QRM, probably because the lids couldn't figure out what it was! Hi...

It should also help reduce selective fade and multipath problems on 10M FM (but again it takes another TS-850 to fully realize the benefits).

I should be available Sunday for sched from mid-US on 75-40-20-10m if anyone wants to try this. I am going to work on a 15M antenna but may not have it done by then.

Have fun!

73

bill

## 23. help ts850 not working

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Stu
Topic: 23  Message: 23

Hi My Call is MM0BSM and hello
I was wondering any of you
have ever came across this problem that I got Yesterday

I was running in the CQWWSSB test this weekend as GM2T on 10m and the radio started to drop power their was a strange smell so I stopped check everything
ANTENNA KT34XA was ok
ALPHA 91B sees ok
VOICE KEYER seems ok
POWER SUPPLY ok
TS850S weird smell and power lost

So after a cpu reset and a test its all ok so reconnect all up again minus Voice keyer and 5mins later same again Try to TX power looks like its going up then falls to ZERO instantly So leave for 5mins connect only radio to dummy load all is ok after 10 mins of keying into load was fine so reconnect and try again into amp antenna and same again

This has me puzzled so to save damage I disconnect 850 and come home. Have you ever came across this problem?
Its very similar to the dc-dc problem but I don't think it is
Maybe something heating up not sure but the smell is very bad also the fan in the radio is working when I TX so that's not the cause
The only thing I can see is on the DC-DC
board where the X59-1100-00 is. Three capacitors look like they had some heat and are a little brown burnt at the tops of them they are
c626 c625 c624 16v 33uf
Could this be my problem?

Also after looking at websites for Ideas I noticed the keying
page to help in hot switching I also wondered if maybe this is a factor to consider as well. I have used the same set up for about 5 years to key the amp. A cable from the remote to foot switch and also to amp the only thing that wasn't the same was the alpha 91b was someone else's and not my usual one

I am frustrated that my radio
isn't working and looking for ideas to help me solve it. Also the ts850 is like one of the family and I am well annoyed at this happening. I hope it can be sorted as I have tried all the other radios like the ft1000d/mp ts870 etc and none are like my TS850
Ok sorry for going on I am awaiting any info you can give to help me solve my problem before I trust one of the uk dealers to repair it

Any help would be great identifying this fault
Stu MM0BSM

Stu, inspect the PA board very carefully. Sounds like
something is failing in there. Also change the T/R
relay on the small board on the antenna connector, it
may be burning up.

10M is very hard on rigs, even when NOT using the
internal tuner (which I assume, you are not). First
thing to fail (besides the 10M coil relay in the AT)
is the T/R relay.

Circulating currents on 10M can be very large, even
with low SWR values.

What is the input SWR into your amp on 10M with the
rig tuner off?

Hi Bill the input swr without tuner into the amp was 1.1 the antenna is
great swr on 10m and has a wide bandwidth.
the pa board looks ok no signs of any burnt resistors or that
I think I will try and buy one of the t/r relays and give it a try
going to connect radio up into dummy load and test to see if I get the smell
again with the lid off the radio
thanks for your suggestion will give it a try for sure

Hi again
after connecting all up to dummy load I now get no power out on any band or mode also I don't hear the relay clicking.
When on fm and I tx the radio the sound from the speaker doesn't mute I can hear the noise but a little quieter maybe this is the t/r relay not working
I just hope that's all it is
Does anyone have the part number for this relay? I will try pacific parts for this and maybe get a dc/dc board as well

Stu, the T/R relay on the Filter "B" unit is Kenwood
part number S51-1429-05. I don't think RF Parts will
have that one, only Kenwood.

Also check the DC input connector on the back of the
rig, mine was overheating until I got a new DC cord
and cleaned the connections.

Stu, now you have a switching problem. On the RF unit, look for the test point pads labled R8 and T8. You should have 8v in the respective modes on these pads. If you don't, or if both are "hot", you have a switching transistor (or 2 or 3) that has failed.

I have an 850 waiting for parts with that very problem.

Hi Again (feed up hearing me) after some extensive searching and ideas from some others I have came across the culprit I think it is on the CAR UNIT x50-3140-00 next to the dds ic`s. In front of ic4 a small can on top of a plastic bottom looks like the culprit and also has some melted plastic at the bottom it is marked 47 16v and I think it is an electrolyte of some sort think it may be C1 the positive side goes to IC8 which is a voltage reg AN78N05 could this cause my problems?

Ok have to go to bed its 3.11am and my eyes hurt seeing my radio in bits and tiredness

Stu, no we are not fed up with you at all, that's what
this list is for.

Have you checked your power supply? What is it
putting out under load?

Hi Bill the supply seems ok but at the time we were running from generator
and I have just been told the generator packed in as well
Never mind that's the joy of radio
I think the repair is too much for me and I will send it to a repair centre
next week and wait for the huge bill.

I tried Kenwood UK but they don't repair radios and gave me a phone number
of someone else who does and they said not to send till next week some
service so looks like I will have a long wait for my radio to be back on my
desk
Thanks for the help

HUGE BILL? Awww come on.... it won't be that bad!

I could fix it for you but we are too far away I
think.

Sorry for all your troubles, Stu. I really think
maybe a power supply problem or bad ground or
something that popped a bunch of things in there.

good luck!

bill

Yes just a pity I am in Scotland or you could have sorted it for me. I have heard a few stories of the repair shops in the uk one guy got charged $1.61 for a diode and $175 for labour and $21 for return of the radio a total bill of $197 or ?135 so it was a shock
Maybe it took a long time to find the problem and that's why it was so high who knows but I will keep you informed
The conversation I had with Kenwood uk was a little disappointing he said depending on what it was they may not repair it because of the age of the radio so I just hope the people I phoned will be able to sort it for me if not I will have to look for a new radio and at the moment I cant find anything as good as the ts850 so will have to look for a second hand one at least if it doesn't get repaired I will have some spares.
Ok depression set aside So what radio do you own yourself Bill is it the TS850 and if so how do you compare it with other radios?
Stu

Stu, I have an 850 and would not trade it for anything
EXCEPT a TS950SD or a newer FT-1000D! hi hi.. that
and about $1000 cash, hi!

anyhow, contact the guy that did the $175.00 repair.
It can be a real bear to find these problems; and if
this was his first one, maybe yours will go faster and
he will charge less! At any rate, something like that
would be at least $135-150 US through our shop, but I
put a 90 day warranty on my work.

The 850 is a great rig. Only a few shortcomings; the
cw sidetone level control is under the rig, needs to
be on the front panel (mine is!). Fan has dropping
resistor to slow it down, I strapped the resistor to
make fan blow harder (I like RTTY!). AM BC band has
20db pad in it (except for mine, I took it out!). And
the display is hard to read out-of-doors (big deal!).

Other than these things I have not found anyway to
make it better. Oh--install the dual filters for
whatever mode you work, you won't be disappointed.

Why can't you get service manual and fix the rig
yourself? They aren't that hard when you have a
guide!!!!

bill

Hi Bill well I love my ts850 none at present beat it as for the rx its superb i have done the ambc pad mod and I have installed 2 500hz filters and a 270 as I like playing with psk31 as for my next mode of operation that's ssb don't feel the need for any ssb filters with the slope and tune.
I do have the service manual in pdf format and yes it does help but I have no test gear here. As for contest operating the 850 has a few bad points but I got over them
the rit has no zero point for quickness big deal
As for rx on 10m none come close not even the 950 when the bands are empty or full
Ok away to bed early tonight a lot to do in the morning talk later
Stu

Most of my work on the '850s is done with digital
voltmeter and ohmeter! I use Fluke model 83, but
anything will work.

look at the IF unit, find the pads for r8v and t8v.
They could be labled R8 and T8, not sure. They should
switch cleaning from rx to tx mode. If not, I will
tell you what to change. R31 on the RF unit would be
my first choice, it is an RLS35 and they are notorious
for going leaky, which keeps your tx line bias "on"
during receive. This really confuses the radio!

the RLS35 is a cylindrical, smd pin switch diode, very
small, about 1/4" long and 1/16" dia, there are
several on that board. A 1S1587 can be substituted if
you are careful soldering the leads to the board.
Very much better to order the RLS35 and wait for them
(get about 6, they are cheap).

Keep a lookout for a 1mH pie-wound choke, you will
want to put this across your antenna connector inside
the rig.

Hi Bill ok will look out my meter and give it a go if i can find it as i
just moved house a few months back and also seen the mod with the 1mH
pie-wound choke will add that as well

# 39. TS-850 tx problem

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-11-03 15:54:49 UTC
From: VE7AVV (Paul B. Peters)
Topic: 39  Message: 39

I recently replaced the small and inexpensive DC/DC converter board (X59-1100-00) in my 850. Using the wonderful step-by-step instructions from http://www.qsl.net/k0bx, the repair took about 1 hour. For anyone who has done this repair, you'll know that it's the result of experiencing what I have called intermittent transmit. It appears there is a fluctuation on the -6v line causing the board to fail -- but why is my question.

Judging by the comments to other Kenwood lists, I know the failure of this board is relatively common. While I'm delighted to be back on the air, the question that remains unanswered is, why does the DC/DC converter board fail? Is it because of the fluctuating -6v line? If so, why does voltage on this line fluctuate? Can anyone who has actually replaced the DC/DC converter board tell me the root cause of the failure? Is it a weak link in an otherwise strong radio? If so, is replacement of the smd's with discrete components a good modification to ensure long term service?

Lots of questions -- but I would really like to understand what is at the source of the problem. Any and all comments will be appreciated.

Paul, I am not sure why this fails. I have replaced
mine (and put in 1/2 of a 22 pin IC socket to
facilitate future replacement, and to give me a way of
testing these things)... I suspect it is one or more
of the SMD electrolytic caps, perhaps the ckt is very
picky about their value. Perhaps tantalum caps would
be called for here. I will look into it further as
time permits.

# 42. overvoltage protection

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-11-05 02:58:03 UTC
From: David Kepkay
Topic: 42  Message: 42

As a newcomer to the TS 850 and solid state transceivers in general, I was asked by an engineer if it or its power supply, PS 52, had overvoltage protection. By that he means, I believe, is there a circuit in place that will protect the radio/ps should its voltage regulator fail and a voltage surge say 13-20v follow. Apparently some technology has this and others doesn't. There are modules available to install that will offer this protection. I gather he had this happen in a 400 series Kenwood some years ago and designed a "crowbar protection" for his newer 940.
Can anyone answer this because I can't from looking at available schematics.
Many thanks,

David, VE7KET

Don't know about the PS-52, probably no protection
there... I use Astron power supplies for the reason
that they come with crowbar circuit that does work.

The rig itself does not have overvoltage protection.

The 940 has 32volt zeners on the 29volt line to the
final and drivers, but by the time they short out, the
damage is done to the drivers. They blow up.

Thanks, Bill.

I forwarded a pdf on the crowbar circuit to you separately.

By way of exploring and learning more, I note that this gentleman believes this to be important, and it sounds like you do also wrt the PS you use. How often do you see this overvoltage damage in the repair shop and is it an expensive repair? Should we all be considering this mod?

David

David, I should have read your first message first,
instead of last! Hi...

Thanks again for the PDF, will post it in the "files"
section of the group as well as amateur-repairs group.

I see crowbars active in about half of the Astron
repairs that I do, to the point that the SCR is
shorted and must be replaced. This is good, as it
spares the equipment connected to the power supply.
What usually causes the SCR to fail is a spike of some
kind, either off the line or from lightning-damaged
equipment (many times I have told a customer to
replace his radio, but I was able to save the power
supply!).

Overvoltage damage to radios is quite rare, actually.
I have seen only a handful of cases for 4,500 repairs
or so that I have completed. In the one case of an
Astron that went overvoltage and the crowbar SCR did
NOT work, it only put 22 volts into a TS-180. It blew
a couple of regulator ICs, some series resistors and
the audio amp chip, but that was it!

Other power supplies start out at 28v unregulated...
these are nasty and would have done a lot more damage
to this rig than the Astron, which starts out at 22v
unregulated. The Astron has a separate 40vdc supply
for the 723 regulator chip.

As for crowbars, I just run Astrons on my stuff and a
good surge arrestor on the input AC line.

# 56. TS850 computer interface information

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-11-11 19:12:53 UTC
From: ve7avv@shaw.ca
Topic: 56  Message: 56

In response to a recent post regarding a computer interface for the 850, I have uploaded several files for your enjoyment.

While you can use the pricey Kenwood IF-232 interface or a variety of other pre-built options, building a computer interface for the TS-850 is one of the simplest (and cheapest) tasks you could imagine. I have been running a homebrew cable for about a year now and the system works flawlessly. See Files area for TS-850_crtl.jpg file... this is waht I use.

I use Logger for all my everyday logging needs and this interface delivers all relevant radio data to the computer. I have also uploaded a screen shot of the interface using YPLog.

This weekend I'm running in the JA International DX contest and the interface works great with TRLog as well... allowing full band switching as a by-product.

Paul that was a cool screen shot. We need more stuff
like that. There are so many things to try, we could
waste a lot of effort trying stuff that doesn't work.
It's great to have some place to start. We really
appreciate your posts and file uploads, thanks...

# 62. More TS-850 computer interface information

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-11-12 18:22:46 UTC
From: VE7AVV (Paul B. Peters)
Topic: 62  Message: 62

In response to additional questions about programs that can be used when you have computer control enabled with a TS-850, I have loaded 3 additional images to the group files area. I apologize for the file size, but I wanted you to be able to enjoy the image in near screen size... it's a great deal of on-screen information.

A few words of explanation to accompany the files:

All screen shots are taken from the (free) logging program Logger.

In the Logger5.jpg image you can see the entire on screen image including the data entry screen, a portion of my log book, the cluster (in two windows), the built-in DVK... yes it works great with a RigBlaster or other sound card interface and my dual window clock.

In the Logger4.jpg image you can see the data exchange window. Normally you would not have this window open while running the program... it's really for test purposes to ensure the data exchange between the 850 and the computer is operating as it should be... constantly refreshing itself. The data is hexadecimal format and you can see the frequency in the logbook window (28429.99) is the same as shown in the radio data window.

In the Logger3.jpg image you can see SK4UW in the logbook window and at the bottom of the DX Cluster window. With computer control, you simply click on the call in the DX Cluster window and it is transferred to your logbook window... then, if you can hear the station, you work it and the rest is just history.

I've been using the Logger program for a couple of years now and have at the same time looked at all the other computer logging programs in the marketplace. On a strictly feature-by-feature basis, I have not found anything that equals Logger, it's a great program!

You can download the Logger program from http://www.ve9dx.com/. Logger was written by Bob, K4CY/N6BFM/9K2ZZ

# 63. Building the simple computer interface

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-11-13 05:51:42 UTC
From: VE7AVV (Paul B. Peters)
Topic: 63  Message: 63

One thing that I forgot to mention regarding the simple computer interface (TS850_ctrl.jpg located in the uploaded files) was the entire circuit is built into the shell of a DB25 computer plug. I used a mil-spec quality plastic shell DB25 plug and the two parts (diode and resistor) plus required jumper wiring fit nicely with room to spare. As you probably know, when you buy a DB25 plug, it comes in pieces... so you have loads of room to work assembling your $5.00 interface. Be sure you use good quality shielded (multi-conductor) cable to run from your computer to the ACC1 plug on your TS-850.

With a little time and not much effort you'll have the interface up and running. Please bear in mind, this is close to... but not an exact science by any means. Each computer to radio connection has its own local idiosyncrasies, please be patient with the process. It is not difficult.

One last item. if you want to read an interesting article... albeit a bit dated now, concerning station computerization, look at QST, March 1995, p.63.

Paul, thanks so much for your posts. I do want to put my 850 on computer control. This will happen after I do some re-arranging of the shack to accomodate my wife's new home-based computer job!

We do so much appreciate the work that you have put into your posts, the screen shots of the software that you use (see FILES section in the yahoo group TS-850). This information will reside in the archived messages that you have sent so that all may benefit even if they join the group later!

Thanks again for your efforts, they are very much appreciated.

hi, this is federico, xe2nlm, i have had my ts-850s since 1992, and i feel
i have had one of the better hf radio made it until 2000.

right now i have experience almost everything. i have use it for cw, ssb,
paquet, sstv, new digital modes (psk31) etc. i use it as a stand alone, and
also linked to the computer, with direfents softwares.

i would like to have the sm-230, and also the digital recorder.
i have 1 extra filter the yk-88sn-1
i use it with my a3s, and 40 mts dipole and i will try the 160 mts dipole

tnks for making a ts-850 group.

please receive regards and 73

# 70. Filter question

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-01-07 01:59:15 UTC
From: trg46
Topic: 70  Message: 70

Is the YG455S-1 filter a good option to obtain for the 850??? I believe it is a 2.4 kc crystal filter for the 455kc slot. I am still using the stock xcvr with ceramic 455kc 2.7kc filter. Comments welcome.

# 71. Re: [TS-850] Filter question

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-01-07 15:09:02 UTC
From: Bill Leahy KOZL
Topic: 70  Message: 71

The stock filters on the '850 are crystal filters, i
believe. When you put both of them in the line (8.8
and 455 both read "2.7"), you have a bandwidth of 2.4
already with a better shape factor than you would get
with the additional 2.4.

If you "gang" a 2.4 with a 2.7, there will be no
appreciable difference in shape factor than if the 2.4
was running by itself.

I don't think you will see any advantage unless you
change BOTH 455 and 8.8 filters to 2.4. That would be
a hot contest setup for sure.

I haven't found need of it, but I am not phone
contester. I like WIDE audio even on SSB, but I do
have both 500hz filters for CW and that is awesome!

From: Stu
Topic: 70  Message: 72

Have to agree with Bill on his comments

I like ssb and have done a few ssb contests at to be honest the standard set up is ample however if you do want narrow ssb I would suggest the narrow ssb filter in the 8.8 slot think its a 1.7khz cant mind and my radio is away at the moment.

I did notice a difference with the narrow but I like the standard filters better.
also leaves options for more filters in the cw / psk31 modes

I have also filters that I swap from time to time and they are the 500hz or 270hz for the 8.8 selection and I have the 500hz in the 455 selection

so their is a few options

Topic: 70  Message: 73

FWIW, I switched to several International Radio filters in my TS-850 recently, and am very pleased with them. I did have the optional Kenwood 1.8-kHz SSB and 500-Hz CW filters in the 8.83-MHz IF, and switched to the INRAD 2.1-kHz SSB and 400-Hz CW filters in the 8.83-MHz IF and the INRAD 400-Hz CW filter in the 455-kHz IF.

While the optional Kenwood filters were very useful, the INRAD filters work much better. The audio with the INRAD 2.1-kHz filter was more pleasant to listen to than with the Kenwood 1.8-kHz filter, while at the same time actually providing better rejection of QRM, especially in contesting conditions.

The dual INRAD 400-Hz filters are excellent. With the slope tuning wide open, they are great for everyday operation and tuning around during a contest. If needed, they narrow down very nicely with the slope tuning.

I was half considering replacing my TS-850 with a newer rig, but after installing the INRAD filters, there's no way it's going anywhere. No connection to International Radio, just a satisfied customer.

73,
Jeff, KC1MK

## 74. Re: [TS-850] Filter question

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Bill Leahy KOZL
Topic: 70  Message: 74

I have had very good experiences with INRAD filters,
starting with their 400hz filter for the FT-101.
AFter I put that in, I HAD to fix the drift problem!
har...

I would like to try the 400hz filters, if I get
serious about CW again. For now the stock filters are
fine, and the two 500 hz filters are almost too narrow
for RTTY/Baudot mode... I actually have to drop the
high end slope control down two notches, which reduces
the slope factor a little, to get it to read very weak
sigs.

# 75. AM/FM high pitch tone in TX modulation

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-01-12 22:49:10 UTC
From: kp4rs
Topic: 75  Message: 75

Hi, great site!!! I have recently purchase an used TS 850. It has 3 problems. 1st it transmits a tone (@ 5khz) together with AM and FM carrier (It is faint around 10% mod on AM) I think is a problem in the IF, but maybe some knows what it is ( no need to reinvent the wheel). 2nd problem is the same tone can be faintly heard on AM stations during rx but I get rid of it using the SLOPE TUNE. 3rd problem is that the MONITOR function doesn't work. No audio at all, and is not a side tone adjustment. Any assistance is greatly appreciated.

Joe

Thanks. Hope the group is helpful to you.

Most problems like this are caused by a leaky or bad
diode D31 in the RF unit. It is a type RLS-135 smd
diode. If you have a service manual you can find this
part and replace it. It is usually caused by a nearby
lighting hit or static build-up on the antenna.

If you feel that you cannot repair this, feel free to
contact us, information is at www.amateur-repairs.com.

After it's repaired, you can parallel the antenna
connector with a 1mHy choke, to bleed off harmful
static that can accumulate on any non-grounded antenna
(1/4 wave verticals, dipoles, etc).

Si Federico, moni y moni vol trabaja muy bien.

I modified my 850 so that the CW sidetone goes through
the MONI control. I can adjust the CW sidetone volume
from the front panel of the rig.

hi and thanks for the egroup...
I have a ts-450 and running it on psk..I have a carrier when I am on lsb and usb..so guessing i need to supress it some. I don't have a tech manuel and would like to know the VR for carrier suppression...

I had to do this to my 440 also and was not as bad and was able to fix it myself for I had tech maneual.. if someone can let me know the pots and names and location would be great.

73 from north idaho.
email is n7uvh@...

tu.
Pat

How much carrier do you have, and how are you checking
it?

# 85. WTB: SO-2

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-01-24 17:35:08 UTC
From: ve7avv
Topic: 85  Message: 85

I am looking for an SO-2 (Stability TCXO temperature compensated crystal oscillator)for the TS-850. Does anyone on the list have one they would like to sell, or perhaps you know of a source for the device. Please advise by return email.

StoneyGround Station

# 86. Pwr output on TS-850?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-01-26 18:21:16 UTC
From: ve7avv
Topic: 86  Message: 86

While the power output of my TS-850 appears to be withing spec according to the Operating Manual, I am curious what other TS-850 owners are seeing as power ouput from their radios. In particular, I wonder about 10M -- on my radio, output (measured with an external meter)is only 65 watts. While that seems low, I have no point of comparison other than the Manual. Power output on all other bands appears okay and is between 80 and 95 watts.

If you are able to respond to my request, please let me know what type of external meter you're using to measure output power. All my readings were taken with an Autek Computing Meter inline to the antenna versus a dummy load.

From: Bill Leahy KOZL
Topic: 86  Message: 87

Paul, I don't doubt your meter readings. The VSWR
protection setting may be a bit low on your 850.

Try tweaking VR8 on the RF unit for a bit more power
on 10m; remember where it was, and if there was no
change, put it back. If it changes power on 10m with
rig into dummy load, continue turning so that it
increases power until there is no longer any effect.
Then leave it there. If you can use a tuner to induce
a 3:1 SWR on 10m, you can set VR8 so that the rig
draws no more than 10 amps.

# 89. Co-Moderator needed

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-02-07 20:07:22 UTC
From: coorsbill
Topic: 89  Message: 89

I need a volunteer Co-moderator for this group.

Duties include checking Yahoo profiles on new applicants, approving them with the proper moderation settings and greeting them. Duties also include making sure that posts stay pretty much on-topic and that any heated discussions get moved off-line from the group.

Co-moderator fills in for Moderator when Moderator's wife needs foo-foo time, or if moderator is ill or doesn't feel like doing computers some days. It's really a lot of fun, and doesn't take much time. You can put it down on your resumé as unpaid volunteer time too!

Training is provided as is occasional feedback on what a wonderful job you are doing, and of course regular raises for good performance (nyuk, nyuk; see previous paragraph...).

Let me know if you are interested! In case of a tie, the guy (or gal) with the most heavy iron in the shack wins!

73,

Bill K0ZL

For absolute ease of operation and best value, try a Clearspeech Speaker.
I have a JPS NIR-12, which will do more than the Clearspeech unit, but it cost a whole LOT more.
The Clearspeech unit has spoiled me.
The Kenwood DSP-100 is very expensive, doesn't do hardly anything for the received audio, but does wonders for the transmitted audio when used with a MC90.
These are the only units I have used and can comment on.

From: Jeff Kilgore
Topic: 95  Message: 97

I have used a Timewave DSP-59+ with my TS-850 for several years, and the combination works very well. I'm thinking of dedicating my DSP-59+ to portable QRP operation with an FT-817 and getting a Timewave DSP-599ZX for use with the TS-850, but this is not due to any dissatisfaction with the DSP-59+.

The TS-850 with a decent audio DSP makes a fine receiver. Good crystal filters are still very useful; I use INRAD 400-Hz CW filters in the 8.83-MHz and 455-kHz IFs, and an INRAD 2.1-kHz SSB filter in the 8.83-MHz IF, and am very pleased with them.

73,
Jeff, KC1MK

i always have been wanted the DSP-100 , since 10 years ago. and never have
been heard somebody to talk about it

it seems to me that this DSP unit work for the receiving signal and also for
the TX signal.
but with the new technology, maybe this is not good enought to be purchased
as a expensive accesory?

regards and if somebody can tell me also bout the sm-230, does it is
usefull?

regards

I HAVE FOUND THIS ON THE NEXT LINK: (I DOUBT IT IS RIGHT, MAYBE IT IS, I DO NOT NOW)

http://www.eham.net/reviews/detail/1677

ZF1MW Rating: 2/5 Oct 16, 2001 21:56 Send this review to a friend
Not worth it Time owned: 3 to 6 months
I bought one for the benefits of DSP but it was a waste of money. No noticeable effect on SSB transmit or receive reports. Minor improvement on CW. Good filters do a better job. I also have an MFJ 784B which does much better filtering. If only it did not loose that much volume during processing.

W6EZ Rating: 4/5 Jul 22, 2001 14:33 Send this review to a friend
Ok but NOT what you think ... Time owned: 6 to 12 months
The DSP-100 was Kenwood's answer to everyone with a TS850 and TS450 who wanted the DSP like the TS950SDX.

It connecs via a handfull of cables at the board level via a 13 pin DIN cable, another 6 pin DIN cable and a couple of RCA type cables. It will NOT simply pug in between an external speaker and the rig like most add on audio filters.

It has variable bandwidth for receive, can shape the CW waveforms on BOTH receive and Transmit, and can modify how YOU sound when you transmit through it.

For reception, it is not up to par with the current crop of DSP aftermarket units. I know this sounds strange, but it is OLD TECH. DSP was a really new thing when the DSP-100 came out. Designers and programers have learned a lot in the years since. Ok, it works pretty good for reception on CW but it isn't harly worth the trouble for SSB.

What the DSP-100 does do is make a Kenwood Radio sound so extremely sweet on transmit! This unit with the MC-90 will make a nasaly, high pitched, sweaky voice like mine sound almost like an Art Bell or Walter Cronkite on SSB. Ok, never quite that good but the difference is amazing!

So, I run my DSP-100 with my MC-90 with the receiver section turned off and the Tranmitter sectio on for SSB, ( I use a NIR 12 for reception when needed, ) and I run receive and transmit on or off as the whim hits me for CW.

Oh yes, it will detect DSB also.

All in all, I DO love this thing just because of the enhanced ego building qualities of the tramsmitted signal. I confess, I LIKE to get good transmitted audio reports!

Federico Batarse

Date: 2002-02-09 12:32:49 UTC
From: Bill Leahy KOZL
Topic: 95  Message: 102

Hi Fred
I have heard the DSP-100 on the air with the '850 and
it is awesome! Makes SSB and AM sound much better on
TX, was not able to hear it on receive as it was used
on the other end of the QSO! hi...

SM-230 is useful toy, for cool display in the shack,
but I have never felt a need to have one here. I had
a SM-220 which worked also with the '850. I think if
I ran a lot of AM I would like a scope.

Yes.

Reduce power to 50 watts except for short exchanges as
on contests. If you want more power, get a small amp
such as the Ameritron AL-811 or 811H. Chief problem
is the DC connector on the back gets hot.

I have a mod to speed up the cooling fan, will look it
up if you want it.

Same for PSK31, if you TX longer than 5-8 minutes,
reduce power.

You are doing fine, Mike. It's Yahoo that gets the "F"!!! They are messing up clubs, moving them to groups and then setting everyone to "special announcements" so no one gets email unless the moderator sends something out... loosing pics, it's just a real mess. Also Yahoo very slow at times, keeps kicking me out, yakkk..... what do I expect for free?

Hi folks!
I'm new to the group--and the 850, which I only purchased about a month ago.
I have owned a 940, 3 IC-751As, an IC-706, FT-100, and many other rigs. The 850 runs rings around all of them! I am really impressed with it.
I operate a little more CW than voice, but not enough of either one, due to time constraints!
The battery issue worries me but it seems a hard job to get at it...If it were easy I'd go ahead and replace it before problems develop. I may tackle it before too long, anyway.
I'm glad to see this group. A lot of 850 info is given out on the Kenwood group at QTH.net...maybe someone should advertise this group over there!
73 to all,

Here is a question/ idea.
Please comment on whether the idea is a reasonable approach
and suggest what is a better approach.

Questions-- How difficult to access are the conductors that
are connected to the memory retention battery? Would it
make sense to take a reading at some accessible point with
an accurate digital Voltmeter to see if the battery is near
gone? In the same work session, could a person see whether
the battery is leaking?

This assumes the following points:
1. the battery is unhandy to replace.
2. The owner might worry about the battery's going dead or
leaking.
3. The owner does not want the inconvenience of digging out
and replacing the battery if it still has several years life
remaining.

How about it, you who have dug into the radio?

HI Fred
Well I really like the stock 500hz filters that Kenwood puts out, they just sound great and if I want to work RTTY they are wide enough, I can still use both of them and get great copy.
I am worried that the 400hz filters put out by International Radio might be too narrow for RTTY if used together. Besides, I don't have 240 dolares!

Don, you can just remove the radio covers, and two of the four screws holding the front panel; rock it forward, and measure the mem battery. I think the top of the battery is plus, the other voltmeter lead can go to any convenient ground. If the battery is 3.0 volts or greater, and not showing any white powder or "hair", you are good for another year. The PC board underneath the '850 mem battery is easily damaged.

# 117. Hello From KAØVKF

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-06 19:48:57 UTC
From: Kevin Hunter
Topic: 117  Message: 117

Hello All. I am a new member to this group and I wanted to introduce myself. My name is Kevin Hunter - KAØVKF. I live just northwest of Springfield, MO.

I have owned my TS-850SAT since November of 2001. I have owned the DSP-100 unit for it for less than a month and have not had the opportunity to use it much yet. I have the IF-232C also, but don't use the computer control very much. I still use paper logs.

I have installed an Inrad #103 400 Hz CW filter in the 8.83 section. The single filter is quite adequate for my, mostly novice band, CW operation. I have the Inrad 2.1 kHz SSB filter in the 455 kHz section.

This radio has been an unbelievable improvement over the TS-140S that I was running before.

I operate mostly on 1.947 in the evenings between 6 and 10 PM CST (Shift work permitting). There are a few TS-850S users that operate there. Please drop by and visit.

73,
Kevin

Is it possible to place some sort of insulated material, such as a small
sheet of plastic, under the battery and maybe prevent damage to the lower
board?

I am asking this, having never looked in there.

73,
Paul K4PDM

Hi Kevin! Welcome to the group and thanks for your patience, it took about a week to get your first post up due to Yahoo problems and so forth. Should go much faster now.
I am glad that you are happy with the '850. Are you active on any other bands besides 160? 1947 was a good year, but I don't have an antenna for that yet!
I like to hang on 80-40-20 and 10 meters. Working on 15m loop wire to put up, maybe today or tomorrow. I think 15 is going to be THE band, as we head out of the sunspot max. and it's so BIG! 450 Khz... I intend to do CW and some AM work there.
The DSP100 makes great AM! I couldn't believe it when I heard an 850 with DSP100 on am on 75m one night. The guy was using it and a linear, about 400watts carrier, and it sounded better than most of the old vintage AM rigs!
It will also allow you to experiment with high-fi SSB. Give a listen down on 14.178 plus or minus 5khz, you will spot them when they are on... sounds like broadcast stations...
bill

I have owned my TS-850SAT since November of 2001. I have owned the DSP-100 unit for it for less than a month and have not had the opportunity to use it much yet. I have the IF-232C also, but don't use the computer control very much. I still use paper logs.

I have installed an Inrad #103 400 Hz CW filter in the 8.83 section. The single filter is quite adequate for my, mostly novice band, CW operation. I have the Inrad 2.1 kHz SSB filter in the 455 kHz section.

This radio has been an unbelievable improvement over the TS-140S that I was running before.

I operate mostly on 1.947 in the evenings between 6 and 10 PM CST (Shift work permitting). There are a few TS-850S users that operate there. Please drop by and visit.

73,
Kevin

# 120. Re: [TS-850] Battery inspection?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-08 00:30:40 UTC
From: Bill Leahy KOZL
Topic: 113  Message: 120

I would not place any material under the battery, there is no clearance.
If you are not comfortable working with the modern boards, get help. They are very difficult to unsolder from, because the holes are very small and the solder does not "wick out" like it did in the older rigs.
Bill

Is it possible to place some sort of insulated material, such as a small sheet of plastic, under the battery and maybe prevent damage to the lower board?

I am asking this, having never looked in there.

73,
Paul K4PDM

# 121. IF filters for RTTY/data

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-08 12:25:29 UTC
From: bud Thompson
Topic: 121  Message: 121

Deltona, FL
Friday Mar 8 0700EST

My Kenwood TS-850S/AT has been in 24/7 ARQ BBS/MBO service since April 1993. The Winlink software MBO runs PacTOR-I, PacTOR-II, and CLOVER on HF. (It was AMTOR (APLINK) in the early days!) The program group controls the radio to scan frequencies (QRGs) on 80, 40, 30, 20, 15, 12, and 10 meters. This scanning includes putting the radio on the right QRG, selecting mode, filters, and slope tuning selections.

What a radio.

In 1997 the 850 was out of service for about six weeks during our move from Las Vegas to Central Florida, and has been back to Kenwood once for about two weeks. A couple of lightning surges resulted in out-of-service repairs taking less than a week each.

What a radio.

Like my 16-year old cat, I will really miss my 850 when it finally fails beyond affordable repair. Quite frankly, there is not an Amateur Radio HF rig on the market today that I would consider purchasing for this service, but I realize I will have to eventually.. don't know how much longer my cat "Ropie" will last either. (Sigh)

In FSK mode, the natural selection of narrow filters uses the 500hz filters in both the 8.83KHz and 465Khz IFs in the 850. In FSK mode the 850 makes an excellent choice for data modes: 170hz or 200hz shift RTTY, AMTOR, PacTOR-I, and G-TOR. Some transceivers (including my Yaesu FT-900) do not include FSK mode and AFSK must be used for data modes with the transceiver in SSB mode.

Data modes these days, including those above, are run by many in AFSK LSB mode rather than FSK mode. In addition, CLOVER, PacTOR-II, and PSK must be run in AFSK. The US standard is to use LSB for data modes except for PSK which is standardized on USB (at least on 20m).

In many transceivers, including the 850, using AFSK complicates matters for having an IF that is nominally 500hz wide. In FSK mode, the receive injection frequency for the 455KHz IF is offset to accommodate the narrow filter. This is not the case in either USB or LSB modes. So far as I know, most folks using the 850 in LSB AFSK use the 500Hz filter in the 8.83 IF and the wide (2.7Khz) filter in the 455Khz IF. I also crank in the LOW Slope tuning to about the 10 o'clock position which seems to help w/o making the tunnel too narrow.

A new mode, PacTOR-III is about ready to emerge. This will require 2.4Khz of bandwidth - so hang on to the Kenwood 850s!

73,
bud Thompson, N0IA
n0ia@n0ia.#cenfl.fl.usa.noam

Note the obvious absence of Packet in the list. For several technical reasons, packet is not as applicable to HF as the other data modes. While it is possible to use FSK and the narrow filters settings for Packet (depending on the data controller), most packet BBS operators use AFSK. (Do not turn this into a thread on what data mode is best for HF - I'll not respond on this reflector.)

Thanks for the note Bill. The only other place that I operate very much is 40 CW, usually in the novice band. I have worked some AM on 10 meters, but not since I've had the 850. Maybe we can work out a sched and try to some AM to put the DSP-100 "through the paces". I have a spectrum analyzer borrowed and have been learning quite a bit while trying different filters and DSP settings.

# 126. New Files added

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-09 19:19:04 UTC
From: ve7avv
Topic: 126  Message: 126

Recently I acquired what I think is a very handy Kenwood accessory; the RM-1 Remote Function Interface. It connects to the ACC 3 position on the rear of the TS-850. While this item did not appear in the original TS-850 brochure, I understand it was used for both the 850 and 950. Given I couldn't find a picture of the device on the Internet, I thought you might like to have a look at it.

If you have the DRU installed in your TS-850 -- and use it often like I do, you will really like the functionality and ease of use provided by the addition of the RM-1. The keys on the RM-1 are larger than the equivalent keys on the radio and checking your split frequency has never been easier than with the interface attached.

I have added a photo of the interface itself and another showing the relationship to the keys on the face of the TS-850. Both images are now located in the Files section of our group area on the YahooGroups server.

# 128. RTTY 101?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-09 21:59:09 UTC
From: Paul B. Peters, VE7AVV
Topic: 128  Message: 128

I am interested in learning about RTTY using my RigBlaster Plus soundcard interface. Recent posts' to our group suggest to me their are some experts amongst us that might be able to get me (and others) started in what I think might be a very exciting new operating mode.

If there is someone within our group, I would really appreciate a response that outlines how I go about setting up to tx RTTY using a soundcard interface. I already have the MMTTY program and I've been able to successfully rx RTTY -- but I want to take the next step and feel I need a little help. When I say "setting up to tx RTTY" I really mean step 1, step 2 and so on. Real basic information please.

Any and all responses would be greatly appreciated.

# 131. TS-850S adding 455 kHz filter- option slot already filled

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-12 18:04:48 UTC
From: Don
Topic: 131  Message: 131

Hello group,
Is anyone familiar with a method for adding more crystal filters to a TS-850S beyond the number of option slots?

As a result of a package deal, I will own not only the planned-for International Radio 2.1 kHz wide SSB filter for the 8.83 MHz IF, but also the INRAD 2.1 kHz wide SSB filter for the 455 kHz IF.

I already have in place, the 400 Hz filters at 8.83 and 455 so there are no open slots for adding the 2.1 kHz filter at 455 kHz. I believe the pair of 2.1 kHz filters operating together would be an asset for SSB.

Here, for comments, please, is a tentative method, not fully verified on the schematics:
The concept is sharing the 455 kHz option slot between 2 filters.
At present, during CW and SSB operation, I can use the 455 filter pushbutton to select the 455 kHz 400Hz wide option filter. If I simply add a pair of miniature SPDT latching relays to swap the same slot between that filter and the new 2.1 kHz filter, all should be OK, right?

The relays would sit on a board that plugs into the option slot. The two filters would be mounted nearby.
I would have to make a manual pair of momentary buttons available for operating the added relays or I could add some internal hard wired logic (plus drivers to handle the relays). The logic would be "if the 400 Hz 8.83 MHz filter is selected (IC3, pin 4), unlatch the relays and if the 2.1 kHz 8.83 MHz filter is selected (IC3, pin 8)then latch the relays.

Would there be a big advantage to doing diode type switching instead of relays?

All feedback is appreciated.
Thank You,
Don WN9V

Topic: 131  Message: 133

Bill,
That's true. Using just a manually operated dpdt switch
would work. I would prefer to keep down the length of the
filter wiring. I will investigate mounting the switch at
the option plug-in site and actuating the switch with a push
rod. This would resemble the way an internal switch is
actuated from the front panel of an oscilloscope.
Thank you for the suggestion,
Don

Don, the switch would only be handling some DC
switching current for the diodes, not the IF signals.
You can mount the add'l filters on some perf board
near the IF and RF units, there should be enough room
there. As I said, use the existing circuit and build
an "extension". Then you can put a small switch on
the back of the rig to select them.

Bill,
Thank you for the further explanation.
When you mentioned a DPDT switch, I pictured the switch itself switching in and out both ends of two filters, which would not the best approach.

Yes, I agree diode switching is more practical. I believe all the required diode switching at the 455 kHz IF area can be managed by one SPDT switch.

Putting a small switch on the back of the radio sounded good to me until I tried to reach back there. The 850 is fairly deep, so I will probably install the added switch in a small outboard box secured to the side or bottom of the cabinet by one of the cover screws . Whatever it takes to avoid drilling holes or damaging the finish.

Here is the scheme as I now visualize it. The radio as-is applies DC to wire 45A, enabling the existing 455 kHz filter option slot (which contains a 400 Hz filter). In the 455 kHz IF which already has that one filter, I am adding only one more filter (a 2.1 kHz filter). The plan is to build one new filter option slot (a board with 4 resistors, 4 capacitors, 2 diodes and the new filter), just duplicating the circuitry of the existing option slot. Then add a SPDT switch that will select which one option slot (existing or new ) will receive the DC from wire 45A. Taking the switching DC from existing logic-driven wire 45A rather than from a steady DC supply will prevent paralleling multiple crystal filters at the 455 kHz level. In the future if a third or more optional filters are desired, more boards could be added and the SPDT switch could be replaced by a multi position selector switch.

How does that sound. Am I following you OK now Bill?

There is another method that would un-install more easily but would take more parts and room to build. I mention it here for completeness and I do not think you are suggesting this method. I do not favor this method as it adds an additional layer of diode switching and puts more components into whatever signal path is active. In order to make use of two optional filters at 455kHz, it would involve building 2 new filter boards. Most of the connections for the installation would be by plugging wires into the existing filter option slot. The diode switched selection between

the two new boards would be directed by a new SPDT toggle
switch which has a constant voltage as its source.

Again, thank you for the input. It is lots easier to
review and revise now before it is installed.

Bill, Thank you for the assistance.

Now that we have done the design concept, I found the
"TS-850S IRFT Filter Installation Instructions"
The instructions mention "ask about our TS-850 Fourth filter
kit"
I will let the group know what I find when I investigate
INRAD's kit.

## 139. yahoo groups downtime

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-14 21:12:29 UTC
From: coorsbill
Topic: 139  Message: 139

Please note that Yahoo Groups (and this group's mailing) WILL BE DOWN FOR MAINTENANCE from 9PM (PST) Friday night through sometime Sunday morning.

I am not sure what happens to posts to the group in that time frame. You may want to avoid sending emails to the group to avoid re-typing them if they don't post.

God bless, y'all have a great weekend.

73,

Bill

# 140. Re: TS-850S adding 455 kHz filter- option slot already filled

Date: 2002-03-15 02:52:54 UTC
From: ve3mij
Topic: 131  Message: 140

Hi Guys,

I'm new to the group, and this is the first message I've read... So pardon me, if I make a faux pas!

I just read through this, and the first thought that comes to mind, is, if you are looking to put in a 400 Hz and 1.2 KHz filters on 455, then chances are pretty good, you will be selecting only certain filters on 8.83 to go with either selection.

So... If you tap off the selection voltages on the 8.83's you could use this with some simple logic to select, either the 400 or 1.2 automatically, when you have that "500" filter selection on 455.

e.g. CW filter on 8.83 selects 400Hz on 455 when "500" indicator is lit, and wider filters select 1.2K.

A diode from 8.83-270 and a diode from 8.83-500 drives a voltage SPDT relay that directs power from the 455-500 selection to the N/C (1.2K) or N/O (400) filters.

Just a thought...

# 141. Hi all...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-15 04:06:37 UTC
From: ve3mij
Topic: 141  Message: 141

Hi to the group, I see there have been some introductions, so I'll do my bit.

I've had my TS-850S/AT new since Jan '91 (If I recall correctly - I got it about a month after it was released) and have been pleased with it for years. Events in my life (like a daughter being born) took me away from it in the last 5-6 years, but I'm pleased to be playing again.

In the early '90's I wrote some remote software under windows, called KMIJ that drives the 850/450, but it seems to have disappeared from the web in the last few years.

For a living, I sell Test & Measurement equipment. Presently for Tek, used to sell for HP (the YL still works at HP, she's VE3ECE) and was an Inspector with Canada's Dept. of Communications at one point. (That's like an FCC Engineer.)

So in short, I'm a radio geek, and looking forward to enjoying the group!

The best part... When I think how long I've had this rig, and I still love it!

Jim VE3MIJ

P.S. I see my post on the filters was redundant, as the idea to use the 8.83 filters to help select the 455, was already mentioned near the beginning of the thread. Next time, I'll read the whole thread!!

hi , this is federico, xe2nlm, at monterrey mexico, the next week , will be
a very importan reunion of the principals of the goverments around the world
here.
you can see on the tv the mountains arround my city and this is why the name
Monterrey, ( king of montains)

about the software i have some of them:
KENTROL, ken, ts-850 , rigmanager, etc, etc, and i hope you can send to the
group the software you have write.
kind regards and glad to hear another happy owner of a TS-850

federico

Jim,
Responding to your P.S.
I was happy to read your suggested method of
filter switching. Thank you for contributing.
True, the method of filter selection method was
similar, but not identical. Also, your concept
demonstrates that with a bit of cleverness we can
make mods that avoid addition of switches or
buttons. That TS-850 front panel has enough
buttons on it already!

# 144. Alternative to the IF-232C

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-15 05:41:03 UTC
From: Mike Flowers
Topic: 144  Message: 144

Hello Group!

I've just joined the group. The name's Mike and the call is K6MKF. I've been a TS-850SAT user since I bought mine new back in 1991. I think it's a terrific rig, and have had much success with mine.

I'm just starting to get interested in PC control of the TS-850. I know this is probably old news to the group, but I have found an alternative to the IF-232C at: http://www.sarrio.com/sarrio/w1gee.html look for 'Model LCU-3K for Kenwood (IF-232C Compatible)'

I would be interested to learn what software is available for controlling a TS-850.

Thanks!

Mike, K6MKF

Hi Mike, welcome to the group! I've been in for a day... So I'm as new as you.

I built an interface a number of years back, using a MAX232 chip and an opto-isolator which functionally and electrically is similar to the Kenwood interface. The advantage of using the opto-isolator(or coupler) is there is complete electrical isolation between the rig and PC. Many of the circuits I see out there, don't do this. I don't expect that it's a real problem, but at least it's one less place for a ground loop!

Out of curiosity, I've put an order in at the local Ham store for an MFJ interface, which I suspect is similar to the one you've got here. MFJ-5383K Kenwood int. Cable 6P din-DB-25/DB9 is how it's labelled on their site, but I don't see a picture there. They want $49.95 US for it, so there's another alternative for 10 bucks more.

Jim VE3MIJ

Don't worry too much about following the thread back,
heck I even forgot what we were talking about!

I like to set my filters on 500 hz, center on 14.060
and listen for qrp ops... now i have a new computer
birdy there that i am going to have to get my elmer
fudd toroid shotgun after.. hi

Thanks for the post and the link, Mike. I put it in
the "bookmarks" section of TS-850 group on Yahoo.

You guys can add links yourselves, it will save me
some time of posting them.

Thanks and 73!

# 150. Re: [kw-radio] DRU-1 & DRU-2

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-15 21:09:43 UTC
From: Bill Leahy KOZL
Topic: 150  Message: 150

Hi Kev.

Finally got to look up your info.

The DRU-1 was an option for the TM-241 2M mobile!
This is amazing, since it is about a year or so older
than the design for the 850, but they must have
decided to share technology.

The DRU-2 is meant for the 850, and the only apparent
difference is the lack of a "beep amplifier" on the
DRU-2 as the 850 doesn't need that.

As for the low playback audio, can't speak to that as
the audio output circuits for the DRU-1 and -2 seem to
be indentical.

# 151. Re: [TS-850] Re: [kw-radio] DRU-1 & DRU-2

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-15 22:09:22 UTC
From: Jim ve3mij
Topic: 150  Message: 151

Hi Bill and Kevin,

I have a DRU-1 in my 850(same part number on the board as yours, Kevin), it's been there since I bought the rig in '91 as the DRU-2 wasn't in the store yet. I'm not aware of an audio adjustment for it. It works fine, but I agree the audio is lower than it could be. It's one of those things that I thought I should do something with, one day, but never really pursued.

Looking at the schematic, I suppose there could be a little more gain found, but not a lot...

Table 1 in the Circuit Description shows VOA and VOB both low, for Received audio recording. I don't recall being able to record off air. Did I skip a page in the owners manual 10 years ago?

Now to go off on a tangent, I look at IC2, the LR4102N and it looks to be a DTMF chip (decoder, I think) on the board! I never noticed that, until I saw the colorburst Xtal (3.58 MHz). The service manual doesn't even discuss it in the Circuit Description, so I wonder if it's put to work in another rig? Actually, now I look at it, there's also an unused connector labelled DTMF CONTROL on the schematic.

It looks like Kenwood intended to use the board in different rigs, in different ways. Might be nice if there's some way to use this hardware.

Getting back to the audio out, Bill, I wonder if a higher gain transistor could be slipped into the Q6 location. Or is it our Q6 just doesn't have the gain of others (if everyone else is fine with their levels), and Kevin and I are just lucky...

Just had a look at a TM241 operating manual, as it uses the same DRU-1. It has capability to remotely control the voice recording using DTMF and to record off air.

I suppose Kenwood couldn't see the use of those functions on an HF rig!

From: Mike Flowers
Topic: 150  Message: 153

Hi Kevin,

I would suspect that the DRU-1 has a lower level of
output than the DRU-2. There are mods to the TS-850
to attenuate the high output level of the DRU-2 to
match microphone levels, but I see no mention of the
DRU-2 level being too low.

For example:

http://www.mods.dk/mods.php3?model=ts-850&radio=kenwood

73,

Mike, K6MKF

You could find a higher gain device, but much easier
to change a resistor to get more gain if needed.

Only problem with HF DTMF control is you have to be
right on someone's frequency to get the right tones!
Not a problem with FM but with SSB, it would be a
miracle to be close enough! hi hi

# 156. Re: [TS-850] TS-850S adding 455 kHz filter- option slot already filled

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-17 03:52:24 UTC
From: Don
Topic: 131  Message: 156

Bill,
Right you are, Too easy:

I received the following response from the emailed
inquiry to INRAD regarding the 4th filter kit.

"We no longer sell the 4th filter kit. It was a
substitution for the ceramic
SSB filter with one of our 2.1s."

So now we know that the most likely vendor does
not sell such a kit.

So much for taking the easy route. After my
filters arrive and I clear off some other projects
on the bench, I will proceed with the revision and
let the group know how it goes.

OK Don, looking forward to hearing from you.

I have used the 1S1587 diode very successfully in RF
switching applications, let me know if you need some.

# 158. Re: [TS-850] New file uploaded to TS-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-18 19:35:16 UTC
From: Jim ve3mij
Topic: 51  Message: 158

Hi all,

The file that I uploaded on Friday is the last version of the KMIJ windows software for remote control of the TS-850/450. I suspect it must be about 6 years old now, but still holds up pretty well. It's a 16-bit application, so will run in almost any version of windows from 3.1 on, including NT/win2000. I haven't checked it on ME or XP, but I assume all should work well there too.

When I started the software, I was doing it only for myself, for fun, and because there was nothing else for the 850 at the time. Recently someone enquired about it, which got me digging it out and looking at the code again. I hope to bring it into the 32-bit world sometime this year, however, I don't know that it will affect the performance, as it already goes faster than the 850 can talk on the communications port.

One thought I've had, which I would like feedback on, is to put the hooks into it, so data can be retrieved into XL for logging. I'm a rag chewer, not a contester, so logs haven't been a big deal for me. My thoughts here, are, anyone who wants to design a log to fit their own custom desires, can modify XL quite easily. It also would make the logs very transportable between applications.

If you are trying software to run your 850 through the serial port, please give it a try. All comments are much appreciated. Positive and Negative! ( The negative ones, help me make it better!)

73 Jim

P.S. The help file is out of date. I no longer charge for registration, so if you want it registered, send me an email. I only did this at one point, as there were some folks who wanted my time for free, and I didn't have it to spare! I will update the help file eventually and make it freeware.

Thanks for that, Jim. I will check it out!

I have often wanted to be able to "back up" my memory
channels, in case I have to change mem battery...

Bill, If you're curious how it looks, you can run it in "demo" mode with no serial connection.

You can also see screen prints at http://members.rogers.com/ve3mij/

Hey Thanks Federico! It's always nice to get a complement.

For your information, you can record new .wav files, so KMIJ will speak the numbers in whatever language you like. Just create new ones with the same names and replace the existing ones in the KMIJ directory. When you use the Voice Button or Keypad, KMIJ will use the files you created. (Then you don't have to listen to me say them...)

Jim, you have gone international.

Soon you will be a large, global software Ham Radio
control company, driving a cool Porshe to work
whenever you feel like it! hi hi!

# 164. TS-850S A/T Receiver Sensitivity

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-25 17:36:14 UTC
From: bud Thompson
Topic: 164  Message: 164

Deltona, FL
Monday March 25 1200EST

Problem: Low receiver sensitivity on Kenwood TS-850S A/T

My trusty friend may have taken a hit when I tested another HF radio too close! The receiver sensitivity on 20M and above definitely changed by "ear" after I ran some tests with another radio on an adjacent antenna! That said, when I made some digital links the next morning the signal levels on 20 meters seemed to be about nominal! Maybe it has been this way a long time and I didn't notice? Maybe it is intermittent?

Measurements with my service monitor indicate the following microvolt signal levels required for indicated S-meter readings. (CW mode, 2.7khz filters.)

Frequency S3 S6 S9
MHz microvolts required

1.900 12.5 27.8 74.0
3.600 8.0 21.0 54.0
7.100 7.7 18.8 51.3
10.100 10.1 25.8 67.0
14.100 19.6 60.1 130
18.100 23.3 63.0 158
21.100 41.8 106 293
24.900 60.0 153 408
28.100 66.0 166 4500

I'd guess there is a problem above 30 meters, but would appreciate anyone's experience in this matter. I doubt these numbers above 30 meters are nominal.

Also, if these numbers are not nominal- let me know where to start in with my 500w iron and l5 pound sledge hammer. I have a service manual and test gear. If memory serves, there are some switching/steering diodes as well as relays that direct signals from band-to-band and BPF to BPF - With some hints, I might get lucky.

NOTE: If I'm going inside this dark dungeon where most men fear to tread, I have another investigation to make - see the next entry.

Thanks, and
73

bud Thompson N0IA

# 165. TS-850S A/T Auto Tuner Problems

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-25 17:36:36 UTC
From: bud Thompson
Topic: 165  Message: 165

Deltona, FL
Monday March 25 1215EST

Problem: Internal antenna tuner will not seek/match on 30M.

This problem definitely happened in front of my very eyes about two months ago. I was on 30M in a digital autotransfer using the antenna tuner when the local power company provided a quick power down/up transition over less than 2 seconds. The 12vdc buss is on a UPS, so the radio did not turn "off", but there was no RF power output until I disengaged the autotuner.

Now the tuner will not seek on any antenna on 30M. All other bands appear nominal.

I'm about ready to dive in with that 500w iron and 15 pound sledge.

What component do I hit first?

thanks,

bud Thompson N0IA

One of the relays in the TEE network probably has
welded contacts....

remove tuner, unsolder the end of L112 that is
soldered to the ground trace. Now, NONE of the coils
should read 0 ohms to ground. If they do, you have a
welded relay. Pull the 30M relay and see if it
clears. If not, you will have to do some more messin
around to isolate which one.

relays are the JY12H-K, and I don't have any
WWWWAAAAHAHHHHHH.... better stock up. If bud blew
one, everyone in the world is gonna want one!!! har..

good luck

BYE THE WAY PEOPLE, if you don't a service manual for
the 850, GET ONE NOW. It won't do you all that much
good to belong to this group if you don't have one,
unless you just wanna TALK about fixin yer rig! :)

Hello. I had a 850 several years ago. Traided for another radio. Bad choice. Now have a TS-2k and a TS-570. Have found a TS-850 I may be able to get. Fingers crossed.
Does any one out there know where I can down load a TS-850 owners manual (PDF)? 73 Chuck K0ONC

Hi Wes! Welcome to the group, and congrats on doing your own repairs! See, there's not much to it, is there? At least in most cases! hi hi

Did you know that if you cut a 22pin IC socket in half, you can put it in where the DC-DC converter board is, then plug the board in for easier replacement next time? I use my '850 to test those things!

OK on the CW. I suppose you have both CW filters. Are you running the Kenwood 500hz, or IRC 400, or what?

Have you looked at the mod to move the sidetone level to the front panel MON control? I invented this mod back in 1994 or 1995, since I like to work breakin and the sidetone level is very important to be adjustable. By adjusting this, and reducing the RF gain a bit, truly "transparent" full-break-in can be had, even better than the TENTEC rigs.

Chuck, I pray you get your 850!

I don't know about downloading the manual but I have
one here you can photocopy if you need to. Of most
importance is the pinouts on the aux connectors, mic
connector, and the menu stuff. I can get that for you
pretty quick if you need it.

Hi Bill and gang
I run my 850 off a ASTRON 35M power supply..
Except for field day then I USE A CAR BATTERY>>>

Im filled with CW filters.....1. yk88c-1 500hz
2. yk88cn-1 270hz
3. yg455c-1 500hz
4. external MFJ 784B DSP filter

I very seldom use AGC...run in AGC off and use the Manual RF GAIN
for better
signal quality (old Navy Radioman habit)
Who needs S meter reading anyway.....>:)

The TS850 is the BEST all around HF transceiver made...

# 179. TS-850 - 2kd-Henry Interface Cable

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2001-01-22 12:18:40 UTC
From: Mark Stappenbeck
Topic: 179  Message: 179

I've added a big (scary) amp to the shack and now I need to interface the TS-850 to a Henry 2KD Classic. Is there a source for the accessory cable that extends from the amplifier control plug on the back of the radio? I can do the soldering on the plugs that go into the Henry, but from previous experience I know that I'd like to get a plug that's been previously soldered on the connector at the back of the Kenwood.

Cheap is good, but good is better.

Thanks!

Topic: 164  Message: 181

Yeah, mine just got blown too. Kinda nice not having
to listen to all the static now! har har... the '850
sounds like my vintage rigs now. Maybe I'll leave it
thataways...NOT!

Diode D31 is probably out on the RF unit, bud.

Also check the tx and rx 8v lines, make sure they are
behavin'

It is an RLS35 SMD low power pin diode. I have them
here, or you can get them from Kenwood. Probably
better stock up on 'em bud.

VRLS135 is the Pacific Coast Parts number.

This thread has "deep" roots, that will require the wearing of tall boots.
Jim uploaded his TS-850/PC control file to the Files area of the TS-850 group. We've decided that very soon he will be an Internet Magnate, with a .COM startup potentially worth billions. Then I asked him if he would buy us all Porsches. Now you know "the rest of the story".
As I said, getcher boots on.

Cool... A bug!

I'm curious Wes, what version of windows are you running? (You are running windows, right?)

You can try the one at http://members.rogers.com/ve3mij/

Or just look at it, and if it's not of interest, then stop trying! It's not logging software...

If you try it and it still bombs, let me know as there's another way to run it.

Jim ve3mij

(With the red Porsche, like Bill's...)

# 189. software

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-30 03:11:50 UTC
From: Federico Batarse
Topic: 189  Message: 189

sorry for the delay, i am programing in visual basic, and my software do not soport speech recognition, nider speech procesor, but i have another software , a repeater dtmf decoder for mesages on our club repeater, and ( i have programed, even the hardware dtmf decoder) and i use the text to speech voice syntetizer, and i think i is realy great. ( the software for the text to speech is from microsoft, freeware) and also include in the instalation disc the speech recognition.

kind regards and hope to continue talking about.

the tmv7 is a dualbander kenwood mobil radio, it is great, all is pc controlable, but i do nof find all the parameter yet.

kind regards and 73

Hi Jim, Im have a Penii at 333mhz with 327 mb of memory...I run Win98Se
I download the program from both sites again....I use PKzip to unzip with....

When I do the SETUP.exe app I get the message...SETUP ERROR-could not copy
Setup1EX_-.c:windows\setup1.ex

Im not a programer so I dont know what the problem is..
I was just curious and wanted to check stuff out...I play a lot.....:>)

From: Bill Hanrahan
Topic: 187  Message: 191

OK, Bill, I think I will!

I've been licensed since 1979 and had held the call KA1KF until about a week ago, when received a new vanity call, W1VFR. I had been active on HF but in the last few years had sold most of my equipment for whatever reason. I'm now trying to get back into radio, and recently required an 850 which needs work ( a few bad relays, and some other things). The group looked like a good place to be! So, nothing to brag about regarding the station, but I hope to be back on the air in a reasonable amount of time. I'm looking forward to learning more about the 850 (which is a great step up from my old TS-440).

73,

Bill, W1VFR

Topic: 51  Message: 192

OK, I had and solved this problem.

My problem occured because there is already a file in C:\WINDOWS named setup1.exe ... It was probably put there by other software I had installed that just happened to pick the name 'setup1.exe' for its setup executable.

Look in C:\WINDOWS, and if there is a file named 'setup1.exe' rename it to setup1.ex_ then try reinstalling KMIJ again. I'll bet it works this time.

73,

Mike, K6MKF

From: Jim ve3mij
Topic: 51  Message: 193

Thanks Wes,

I'll take a look at that and see if I can work out the problem. I've got a machine here running win 98se.

In the meantime, I've added a link to http://members.rogers.com/ve3mij/ that will give you a zipped version without the windows set-up program. Just unzip it into a subdirectory and you can run it from there.

FYI, the set-up automatically puts the Visual Basic .dll file into your system subdirectory (not system32) and also creates a group with a start icon in your programs. You can do this manually if you want, but it's not needed to try the software.

Let me know if it still doesn't work!

Jim ve3mij

THANKS FOR USING TS-850@...

Your use of Yahoo! Groups is subject to http://docs.yahoo.com/info/terms/

# 194. Re: [TS-850] New file uploaded to TS-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-03-30 13:29:02 UTC
From: Jim ve3mij
Topic: 51  Message: 194

I should have read this one first!

Thanks Mike, this makes perfect sense!

However I will try it on my '98 machine, just in case...

Jim ve3mij

Arn't puters fun...That did it Mike and Jim..
I did a Find search and Bingo...there was a setup1 already
there...renamed that critter and now KMIJ works......
Neato..Nice job Jim....I do like the meters..
Now I would like to run YPLog with handshaking to KJIM.
Is that possible..

Wes

From: Jim ve3mij
Topic: 51  Message: 198

Unfortunately no, Wes.... I don't know if YPLog supports any sort of data transfer, but KMIJ doesn't at this time.

I've been thinking about this.. I'm not really into writing a log program, and there's so many out there that are good, so I was wondering if there's a way to make windows think there's another serial port connected, from KMIJ. This way KMIJ could run, and whatever log program you want, could also run through it in a "pass through" mode.

Any programmers out there have ideas, I'm all ears...

In the meantime, I appreciate the feedback Wes, as it validates one of my ideas for the next version. Whenever that is! (Probably in a 2-4 months...)

Jim

Topic: 187  Message: 199

Bill, we have a lot of Bills on this group.
OK glad to help with the 850 questions, just make sure you get a service manual for it. Not cheap, but less than the filters cost...
Cool callsign!
73!
Bill
Bill Hanrahan <hanrahan@...> wrote: OK, Bill, I think I will!

I've been licensed since 1979 and had held the call KA1KF until about a week ago, when received a new vanity call, W1VFR. I had been active on HF but in the last few years had sold most of my equipment for whatever reason. I'm now trying to get back into radio, and recently required an 850 which needs work ( a few bad relays, and some other things). The group looked like a good place to be! So, nothing to brag about regarding the station, but I hope to be back on the air in a reasonable amount of time. I'm looking forward to learning more about the 850 (which is a great step up from my old TS-440).

73,

Bill, W1VFR

# 204. Re: [TS-850] TS-850 - AMP PRECAUTIONS

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-04-03 03:15:26 UTC
From: Bill
Topic: 179  Message: 204

Mark, this should be a standard amp cable for Kenwood.
Make yer own:

Get 7 pin DIN plug from Radio Shack or your favorite 7
Pin DIN connector place.

Solder a surplus audio cable with attached RCA plug to
match the amp key jack, to the DIN plug. Connections
will be pins 2 and 4 on the DIN plug. Doesn't matter
which pin gets the cable shield; they are floating
relay contacts.

Don't worry about the ALC connection; just tune her up
and let her rip.

CAUTION: The TS-850 IS VERY VERY SENSITIVE TO DAMAGE
FROM GROUND LOOPS AT AC. TO BE SAFE: A) AMP IS
GROUNDED TO EARTH GROUND AND PLUGGED IN AND TURNED OFF
PRIOR TO CONNECTING IT TO THE TS-850. B) GROUNDED TO
THE 850 WITH A BRAID OR HEAVY STRANDED WIRE, GROUND
LUG TO GROUND LUG. C) CONNECT THE RF CABLES, VERY
GOOD QUALITY ONES, NO CHEAP CRIMPED R-S JUMPERS
PLEASE. D) CONNECT THE TS-850-TO-AMP CABLE YOU JUST
MADE. E) CONNECT TS-850 TO POWER SUPPLY.

If the Henry blows any fuses, disconnect the 850 from
the amp in the reverse order before doing anything
else. If you have further problems, let me know.

Hello All -
I have a mint, 1996 TS-850SAT coming in the mail and it has two filters that I am interested in selling, the 270Hz narrow CW filter and the 1.8kHz narrow SSB filter. I thought I would offer them here before putting them on ebay. I would like to get $75 for each of them. They are also mint. Please let me know if you're interested. Thank you.

73,
Bruce K6RQR

For PSK31 the stock filters are fine, you will be using LSB I think and you need the full bandwidth for the waterfall displays to work right.

For DXing, on voice, the stock filters together give you 2.4Khz IF width, which is adequate for all but the most demanding situations. Between that and the slope tuning, you should be able to accomodate most pileups. Most DX works split anyway, which puts the pileups out of your receiver passband.

You can put the 1.8Khz filter or filters in; this will help somewhat on the pileups if they are working on-frequency or during contests when the whole band is congested. But it will give you restricted audio that may add to fatique.

If you are a CW operator, or will be, I highly recommend the stock kenwood 500hz filters. These also work in FSK mode for baudot rtty which is still pretty hot on contests. the Inrad 400hz filters would also be great on CW, but may be a tad too narrow for baudot. The Kenwood 270 hz 8.83 mhz filter (YK88CN-1)is also great on cw and may be all you need to add for that mode. DO NOT buy the YK88CN, you MUST use the YK88CN-1 filter in this radio!!! the IFs are slightly different from the older kenwood. I put a YK88CN in my 850, and boy I thought all my fillings were gonna fall out of my teeth, the passband was so high!

Most of this is just my opinion.. best thing, get other's opinions (especially, someone more contest-minded than I), and try your rig out, make changes as needed, it's the best way to avoid spending unnecessarily.

850's are susceptible to static damage to the
switching diodes in the RF unit and damage to the gas
arrestor tube on the small board that connects to the
antenna connector. The gas tube can be visually
inspected for darkening of the glass (should be clear)
or a visible whitish band in the middle of the black
carbon-looking thing in the middle. The diode damage
would be evident by severe loss of sensitivity, and
bad case would be radio doesn't tx or rx and has a
high-pitched tone coming from the speaker.

you can help prevent both problems by soldering a 1mH
pie-wound (read: antique) RF choke right across the
antenna connector.

This is not a killer to fix as long as you have a tech
that knows what to do! :)

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-05-09 23:45:23 UTC
From: Stu
Topic: 210  Message: 214

I used the stock filters for ssb and then used the slope tune etc for the qrm in contests

as for cw and psk31 I used 2 500hz filters by Kenwood in the 2nd and 3rd ifs and also had the 270 2nd if filter as well

when in psk31 it doesn't really matter what mode of ssb you are on but is the norm to use USB

as for the faults problems etc with the radio well I cant say on that as my 850 had worked flawlessly since 91 to oct 2001 in contests of all sorts and on field days on island in the car
Until it died on the tx side and I smelt some smoke that came from inside

overall a superb radio and much better than some of the top radios in my opinion you don't want to ask long stories

go for the standard filters by Kenwood and u won't go wrong by inrad and ive been told makes a great radio even better

Stu MM0BSM

# 215. Dates of Manufacture for the 850S

Hi 850 users,

I,m a new member of the group since i recently hooked up
an brandnew 850S fullhouse filtering!!
I use to run an 450 & 690 in the past few years, the estetics
from de 850 are simular to the 450/690, now i,m wondering
if i could add a few more MHz above 30 just like the 450 by
cutting a diode on the logic board.

2nd
I,m also currious to know wich mic combination gives me that
broadcast type audio, If have been told to get my hands on a
DSP100 to make it go a little wider

Thank in advance for any help in those 2 directions

Hans PD0RXG Holland

I am not aware of any mods to take the 850 above
30mhz. I use my scanner to listen there if the band
is open; transmitting would be risky because of the
military users there.

Dave,

Is oob transmit ABILITY illegal in your country? In other words, could you get into trouble just for having the mod, not just for using it? If not, that is a factor in favor of leaving it.

Is your Amateur Radio community and regulatory authority talking about a new ham band at 60m (5.30 Mhz approx)? If so, I would reconsider undoing the mod.

If you still feel the need to remove the mod, follow this link to Kenwood TS-450 and just follow it in reverse.

# 221. Autotuner

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-06-21 09:56:09 UTC
From: bud Thompson
Topic: 221  Message: 221

Deltona, FL
Friday June 21 0540EST

I run my TS850S on my Winlink mailbox - the 850 scans many frequencies on several bands under computer control 24/7. So the radio moves from one frequency to the next every three to four seconds until a user makes a link request. What a radio - it has been doing this since 1993 with only a two-month period of rest when we moved from Las Vegas to Florida.

A couple of the bands need trimming with the internal antenna tuner... so if I leave the 850 tuner in AUTO, the tuner is IN for all bands. The trouble is that the tuner wants to re-tune from band-to-band. This means that the tuner is running virtually all the time! The mechanical parts of the tuner were not intended for this constant use and after a time I have a tuner failure... Am I missing an 850 setting that would only have the tuner change tuning when the TX was using the frequency? That way, the tuner settings would remain wherever they were since the last time it was tuned while the radio scanned the frequency list waiting for connect requests. When it gets a connect request, the TX would start chirping with the user and the tuner would tune. That would cut the number of times required for re tuning by 90 percent!

If I can't have the internal tuner do what I need - What external tuner is recommended that will solve the problem? The multiband antennas available are coax-fed and "resonant" on the bands I scan, except each antenna has a slight problem on one or more bands causing the 850 to reduce power on those bands. The reactance there is not all that high or the internal tuner wouldn't provide the match it does.

Thanks for some ideas.

73,
bud N0IA

bud
it looks like you are going to need to resonate your
antennas for the bands you are using, and leave the
tuner out of the line. The only way "out of the box"
to keep the tuner from cycling on scan is to run
"split", with rx on A and tx on B vfo, and scan A...
but then, when a connect is received, how are you
going to cause the radio to switch from tx on B to tx
on A vfo? This will take a computer command, tied to
your TNC that will signal the 850 to do this.

I really hate running internal tuners unless you
absolutely have to, so resonate those antennas!

ksm91011 <ksm@...> wrote: Hello,

My TS-690 has developed a strange behavior. My wife tells
me that my 3 year old was playing with the buttons on day
while I was at work. (Why they were both in my shack
I have no idea. She was probably cleaning the house by
putting excess things out there.)

When I spin the VFO knob to the left it resets the VFO
to ca. 50.74Mhz. Spin right and normal frequency change
occurs. As far as I can tell all other functions are
normal. This happens on all bands. Should I do a full
reset. (I haven't had time to look it up in the manual
yet.) or has anyone seen this before? I am the original
owner, perhaps it time to change the battery? ( I think
there is one for memory retention?)

# 226. External - amp keying relay for TS-850?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-07-14 22:41:16 UTC
From: ve7avv
Topic: 226  Message: 226

I am looking for input from other 850 owners on what type of external keying relay configuration they might be using if they have a linear amp connected. I have scoured the web in search of answers related to this issues and while I've found a few pages, it's nothing definitive.

My 850 is connected to a YAESU FL-2100Z amplifier. At present, the way I have things wired, the 850's internal relay (using pins 2 & 4) provides a short to ground that keys the relay in the amp -- I wonder if that's fast enough or too fast for the amp -- I don't know the answer. I have not had any problems to date, but I'd really like to be sure. My objective is to provide a more industrial strength interface so as to not rely solely on the 850 doing all the work. Should I be looking at the actual relay in the amp itself or attacking the problem from the exciter side of the equation? Or is the linear keying relay in 850 more than up to the job.

As always any thoughts and or assistance would be greatly appreciated.

I just use the relay in the 850 to key my old Amp Supply amp. I don't do
QSK with it, though.

Topic: 226  Message: 228

Have used my 850 with relay system in the SB220 for years without any problems. I don't think there is a problem with speed; however, for the keying purists and those that would like to explore full break-in operation with any older tube amp, Rich Measures ran a series of articles in QST describing his method of setting up a keying circuit using a small T/R relay from the TS-940 for the input and a Jennings vacuum relay for the amp output, then a very simple way of sequencing things via R-C constants here and there to make sure everything is made before the RF starts flowing.

As for outboard relays, I would never advise AGAINST using them, but in this case I think it is unnecessary. What I HAVE done is switch the cap and resistor on the SB200 keying line (similar to the FL-2100 series) so that the cap is not directly across the keying jack on the amp; this reduces the make/break current on the key line which is what welds relay contacts. A 0.01 mic cap can store a LOT of energy. You can do this on the FL-2100 but as I remember, if it's not done right it can mess up the tube bias...??

# 232. TS-850SAT AT UNIT

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-07-18 15:34:07 UTC
From: coorsbill
Topic: 232  Message: 232

Phew, just finished a rebuild on the TS-850SAT AT unit, it wasn't too bad! It really help to take a few pix along the way so I could remember which way the gearsets went in, and so forth...

There is a trick to setting up the pots and the varicaps... I will try to document it later and put it in the group files area. Hint: It's NOT in the service manual! hi hi

Recommendation: Yearly, remove the AT unit (it's not hard) and lube the variable capacitor shafts with one drop of 10W oil (or sewing machine oil will work fine too). While you are at it, remove the six screws holding the filter unit on top, lift it and blow the dust out of the underlying PA module. Reassemble, then using a metric wrench, remove the VFO knob and put one drop of oil on the main encoder shaft. You are good for another year!

While you have the cover off the rig, check the small glass-looking thing back by the antenna connector. It is a gas tube arrestor for spikes on the antenna. It should be clear, with a solid black resistor-looking thing inside. If it looks smoked inside, or if the black resistor-looking thing shows a band of light brown or cream in the middle, it is DOA and should be replaced.

Kenwood part number is DSA301LA, also available from ICOM and I usually have some at the shop.

As for RF Parts, if you just can't get by the 25 dollar min order, let me know what you need I may have it.

Date: 2002-07-18 19:07:13 UTC
From: ve3tmt
Topic: 234  Message: 234

I am new to the group and wanted to introduce myself. My name is Max and the QTH is Kingston, Ontario. I am running a Kenwood TS450S with a Behringer EQ/mixer. Being in a severely "antenna restricted" building, I enjoy making and testing antennas (ones I can hide), so far the small loop has yielded the best results, until the antenna fell over and the vacuum cap smashed. I still cry over that one! I may just purchase an MFJ loop for the yard, I know they aren't much, but it will get me out better than my longwire. I also have an TS711A for 2m and an Icom 738 for HF backup. Does anyone have a copy of the 450's service manual? I would gladly pay for any costs involved in getting one. I am also looking for a DSP100 unit if anyone has one for sale. Wide SSB filters(2.8Khz?)for the 450 as well.

Thanks,

Max

# 235. Feeding mic audio through ACCY connector

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-07-18 19:43:33 UTC
From: ve3tmt
Topic: 235  Message: 235

Currently I have the audio (PSK) tones fed into my 450 through the mic jack. I run the computer tones and mic audio first through a Behringer mixer/EQ and then onto the radio. I would prefer to run everything through the 13 pin accessory port on the back of the radio. The audio pin is labelled Packet Data, and I want to make sure it would be ok to feed mic audio through this pin as well. I did this on my Icom 738 and it worked fine, but soldering those darn 13-pin DIN plugs is a real pain, and want to make sure it will work before I take the old plug off.

Comments?

Topic: 234  Message: 236

Hi Max! Thanks for writing in. Good luck on the items that you seek; the problem with the TS-450 manual is that it is quite large, and any color shading that is in there to help delineate the PC board traces would be lost with a photocopy. I am afraid that copying one of these would be a formidable task. If you were to pay me, it would cost more I think than the one from Kenwood which alas would have the colors intact! hi..

Ok on the Barringer... I have heard that unit on the air (14.178, one of my favorite hang outs!) and it is impressive!

I would like to be able to go DSB through the 6khz filters on my 850 just for grins.

It will work. I have the required impedance and audio
levels at home, if you need these let me know.

yes the 13 pin is a pain but using the right size wire
(TINY) and tinning the leads properly, and avoiding
caffiene will help a lot.

PS does anyone object to changing the name of this
group to TS-850_TS-450_TS-690? They are all
"brothers".

Thanks, let me know.

Bill,
Did you know that there is a hidden menu setting in the 850 that will
allow you to select any frequency on transmit, as well as receive?
Not sure if this is what you want, but the info is at www.mods.dk
and it works on my 850, although I have never used it on the air--just to
try it on my own headphones.
The 850 is an awesome rig!

Which menu item is this? Is it menu item 35?

Thanks and 73,
Jeff, KC1MK

No, 35 has to do with running two-TS850s in split
mode.

I hope everyone knows I meant "filter," not "frequency!"

No, it is item 01 in the menu that you access by pressing SCAN+TX-MCH at the same time. Allows you to transmit thru the 6 kHz filters if you want. I have done this only for testing purposes, as I am not sure of the true bandwidth and question its legality.

It would be legal on HF fone freqs as it doesn't
exceed the bandwidth of an AM signal.

Not good to "hog" a second SSB channel unless the qso
you are in calls for DSB.

One NCS I know runs DSB, if QRM hits you just flop
over to the opposite sideband and there he is!

There used to be a regulation invoving "good amateur practice." I'm not sure these wide SSB signals are "good amateur practice."As we all know, part of the purpose of SSB was decreased transmit bandwidth.

Paul,

Don't forget that we are also supposed to be "experimenters". I also run AM on HF, and intend to build a vintage tube, plate-modulated rig for that mode. I find it quite enjoyable to run hi-fidelity modes on HF fone (and, even FM on 10m which uses up even more bandwidth).

In some situations, good amateur practice demands efficient, narrow-band modes, and in those cases I use them, such as in DX pileups, contests and nets. I also use the narrowest of the modes, CW, most often when on the air.

Good point about the "experimentation," Bill. It is just a personal thing with me. I would love to have a good AM station. I guess I feel that AM is the place for folks who are after better fidelity.

On SSB, I don't think you can get much better than nice, crisp, articulate sound. I listen to the "Hi-Fi" folks thru the 6 kHz filters, and although they sound really smooth and mellow, to me it is just not how SSB is supposed to sound. I like it fine on AM.

I work in broadcasting and have access to lots of audio equipment and mics, and haven't really used any of them on the ham rigs. Just not my thing (which is not to say it never will be!)

Hi Paul.

The first time I tuned those guys in (and I mean "tuned"... they are hard to get just right!), my wife poked her head in the door and asked me who was in the shop with me! Can't get better compliment than that!

Phew, glad we were able to come to agreement on something!

Now... on the tx filters selection, I found the menu choice... it's SCAN + TX-M.CH and POWER on, then, menu choice 2 to allow filter selection in transmit, default is OFF. Another important setting on this menu is 7., to turn subtone ON or OFF, default is ON. Even if turned OFF, the display will read ON. hmmm

Hi all,

I am trying to find the optimum point for feeding audio into my TS450. I currently feed it into the ACCY connector on the back through the PKD (packet data) input. However I find on voice modes the average output is only around 30-40 watts however if I inject a 1 Khz tone into the same input it will easily do over 100 watts out. I use a condensor mic through a Behringer EQ and have tried all different types of settings. If you look at the IF board schematic, the PKD input goes through a network into the mic amp IC, the input from the mic connector itself ends up at the same spot only through a different chain. I have tried bypassing the mic gain pot, my audio tap is currently at MICVR2 (at the base of Q43) just before the input to the Balanced Modulator. The problem is now the mic gain pot still controls the input audio in a different way. At maximum CCW there is no audio, at maximum CW the same thing. At 12:00 there is input. It still functions properly through the mic jack, giving me an even increase through the rotation. Please take a look at your schematics and give me some ideas. I am trying to find the cleanest input point in the rig.

Thanks,

Max

If your audio/PO decrease toward full level adj, it's
because the source is being loaded down too much. You
may need an impedance converter, such as LM324 with
about 1000 ohms in series with the output.

What is the output impedance of the Beringer, and what
is the output impedance of the generator that you used
for the 1khz tone, if known?

that will be a key

When I was driving my PK232 from my aux output on the
TS-850, I had to change the input resistor on the
PK232 and also the gain of the 1st stage as it was
insufficient. Granted, that was going the "other
way", from rig to TU, but the principles and
requirements are similar.

Bill,

Both my mic output and digital (psk etc) output from the computer are feed into the Behringer EQ/mixer. From there I adjust the appropriate output levels into the TS450. I had thought I bypassed the mic gain when I came off the mic gain pot, but the mic pot still has an effect on the input level. What about feeding it directing to the input of the balanced modulator AN612 IC8? Without a service manual I couldn't find Q43 on the board. It may be on the underside.

Hello Bill and the group -
I will look up the website that I found this on and get back to you. It is actually a very simple mod IF you can find the two capacitors with the aid of the service manual, which I don't have. The caps are C618 and C619. The procedure is to locate them and cut the traces that connect them to the NB circuit. This is a real interesting thing as the man who descibed this said that the NB on his 850 didn't seem to work much at all and that this mod greatly improved it. I have an 850 with a serial number of about 60,000,000 which makes it one of the later ones and my NB (NB1) seems to work well. I have a real bad powerline noise problem (it has led me to sell some rigs in the past because I didn't think I could operate from here) and the NB on my 850 makes it much easier to hear weaker SSB signals on 75 and 20 meters. The man who described the mod didn't mention any intermod problems and, in fact, he says that this mod makes the NB circuit just about the same as the NB circuit on his 940 which he says works very well. However, I received an email from someone else who said that the NB circuit on his 940 didn't work any better than the one on his 850! Anyway, good luck with this. I will get the web address for this because it has some comments about the improved performance.

73,

# 262. Noise blanker mod

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-07-22 16:32:48 UTC
From: maritimus49
Topic: 252  Message: 262

Hello Bill and the group -
OK, if you will go to www.google.com and type in "TS-850 noise blanker mod" it will take you to a page of hits. Clink on the one at the top that says "New Page 1" and you will see the information about the mod. I hope this helps.

73,
Bruce

p.s. I must say how impressed I am with the 850. I have compared it with some of the most recent rigs, including an FT-920, and it really holds it own. I also enjoy SW listening and this is a fine rig for that. The velvety smooth tuning makes band cruising fun and I love that Kenwood audio. I use a couple of self-powered computer speakers (Labtec) and the audio is very good. I also decided on the 850 because I had read about the BC band attenuator mod to restore its excellent sensitivity to that band. I couldn't find any mods for several other current transceivers to do that. I would appreciate comments from anyone who has done this mod and the results they got. Thanks.

GREAT Bruce, good backround on this.

I will look into that to see what it actually does, removing those caps, before I try it. My noise blanker, if anything, works TOO well.... I find myself full CCW on the control and still wanting to turn it down some more, to reduce intermod...

Wonder if NB2 could be modified to work on more broad noise such as some power line stuff that NB1 won't touch?

I replaced the resistor that goes to ground on the AM filter mod, with a 1mHy choke, that did the trick.

I also do same mod on the TS-440! That one just requires removal of 3 resistors and addition of a wire jumper on the RF unit.

Other mods I have on my 850:

Fan mod. They have a resistor in series with the 12v to the fan; I jumpered it out to make fan run faster, no noticeable increase in noise.

CW SIDETONE mod, moves the sidetone LEVEL out to the front panel, absolutely necessary for full-break-in CW to work right.

Out of band tx mod. I work on gov't amps at 8.8 and 16 mhz and need to be able to drive them, plus we are getting 5 mhz in couple years...

Lightning prot mod.. added 1 mHy pi-wound choke across the DSA301LA suppressor (glass-looking thing on the ant switch unit), keeps high DC volts from developing across the ant lead in rx (reads 50k resistance to ground in rx mode!).

Bill,

According to the Kenwood manual, if you use Pin 9 for PTT instead of Pin 13 it disables the microphone input from the front of the rig. I wonder if is disables the mic gain pot as well??

Yup I think yer right.. it slams a muting transistor
across the hot side of the mic gain pot, that's whats
drawing your audio down

Bill,

I am using pin 13 right now, haven't tried the pin 9 idea. So if I use pin 9 it should disable the mic pot, correct? As I have it right now, the audio signal coming in thru the ACCY connector goes right to the MICVR2 pin (base of Q43 through coupling cap). I had assumed this was the output side of the mic pot. Yet varying the pot still affects my audio level. I guess I will try using pin 9 for the PTT and see what happens.

Yes, varying the pot varies the load on that circuit.
I will look further when I get home today.
These rigs really need to have an isolation amp on all
the aux inputs (and a photocoupler would be very nice
too!), but they don't

Kenwood TS-850S/AT - I bought this new in 1994 and have used it for my main rig since then. It has INRAD 400-Hz filters in the 8.83-Mhz and 455-kHz IFs, and an INRAD 2.1-kHz filter in the 8.83-MHz IF, and comes with a Kenwood MC-50 microphone and homebrew computer interface (uses Maxim 232 IC, in nice case). The radio is in very good condition, no scratches or dings, non-smoking environment. With original manuals and original box. $1250 plus shipping

I have some additional items for sale on rec.radio.swap, but didn't want to list non-Kenwood items here. BTW, I'm selling this to clear some space and help pay for an IC-756Pro II. I hate to part with it, but I must!

73,
Jeff Kilgore, KC1MK

# 275. Which meter reading to trust?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-07-26 02:59:18 UTC
From: ve3tmt
Topic: 275  Message: 275

Simple question...

MFJ analog meter on tuner shows only 30-40 watts average output on SSB. PSK tones from PC easily drive meter to over 100 watts. Whistles also no problem. However the RF meter on my TS450 easily peaks over the 100 watt mark on either. Understanding that the digital meter on the TS450 is far quicker than the MFJ meter, I'm wondering which one to believe. IF I am in fact only averaging 30-40 watts out, how can I do better? Mic is an Apex 430 studio mic through a Behringer mixer. Any ideas or comments??

Thanks,

Max

You don't want to average more than 30-40 watts!
Believe the meter on the TS-450, if the swr is below
1.5:1 it will be accurate. You should also be able to
set a "peak hold" feature on the menu; I have mine
turned on in my TS-850 and it's really neat!

Look for a "peak reading" wattmeter add-on that can
add peak power hold to any analog meter.

Also, when looking at your transmitter, you should be
setting your mic gain to get proper ALC action at
whatever power output you are set to, and not pay much
attention to the wattmeter.

Jeff you have discovered the TRUE path to marital
peace and long-term success! :)

My wife hit a big jackpot about 8 years ago (we no
longer gamble), and when I got home from work, all she
asked me was, "how much does the TS-850 cost?"... I
said, "with, or without filters?" She said, "With!"

Holy cow I almost passed out. The next day we were
down at HRO picking up the new baby!

Bonnie is KB0HTC by the way; k-b-0-hide-the-cash!!!

I have no problem averaging 30-40 watts, but I barely have to open the mic gain pot before I am exceeding the ALC on voice peaks. Makes you wonder why they even put a mic gain control on the radio. Mine sits at about the 7:30 position.

Max

(Pardon me if this has been resolved.... been out of town for a while and trying to get caught up.)

>However I find on voice modes the average
>output is only around 30-40 watts however if I inject a 1 kHz tone
>into the same input it will easily do over 100 watts out.

This is normal for SSB and FM modulators. The power in typical "voice" input is spread over the audio spectrum from (nominally) 300 Hz to more than 2.5Khz. (Do you sing tenor or bass in the church choir?) An average power meter will average that out, thus read "low". A pure sine wave 1Khhz tone (or any other single tone frequency in the passband of a transmitter) has its power concentrated in a more narrow band, thus "reads" more apparent power output on an average reading meter. Bet that if you used a peak-reading meter you might see less difference between the two tests.

If you are using AFSK (LSB or USB) mode for data (packet, PacTOR, PSK31, etc) on the Kenwood 450, you would probably be ahead to use the 13-pin ACC line input as that is what it is designed for. If your data controller will support FSK, you'd be ahead to use FSK! (Yeah, old fashioned, but a keeper!)

>When I was driving my PK232 from my aux output on the

Very typical of the PK-232! I don't know of any Kenwood (940, 850, 450) that can be driven properly by the stock PK-232!

Subject: TS450 experts...get your schematics out!

Hi all,

I am trying to find the optimum point for feeding audio into my TS450. I currently feed it into the ACCY connector on the back through the PKD (packet data) input. However I find on voice modes the average output is only around 30-40 watts however if I inject a 1 Khz tone

into the same input it will easily do over 100 watts out. I use a condensor mic through a Behringer EQ and have tried all different types of settings. If you look at the IF board schematic, the PKD input goes through a network into the mic amp IC, the input from the mic connector itself ends up at the same spot only through a different chain. I have tried bypassing the mic gain pot, my audio tap is currently at MICVR2 (at the base of Q43) just before the input to the Balanced Modulator. The problem is now the mic gain pot still controls the input audio in a different way. At maximum CCW there is no audio, at maximum CW the same thing. At 12:00 there is input. It still functions properly through the mic jack, giving me an even increase through the rotation. Please take a look at your schematics and give me some ideas. I am trying to find the cleanest input point in the rig.

Thanks,

Max

Subject: Re: TS450 experts...get your schematics out!

What is the output impedance of the Beringer, and what is the output impedance of the generator that you used for the 1khz tone, if known?

that will be a key

When I was driving my PK232 from my aux output on the TS-850, I had to change the input resistor on the PK232 and also the gain of the 1st stage as it was insufficient. Granted, that was going the "other way", from rig to TU, but the principles and requirements are similar.

Most terminal units, if you are using a fixed audio
source from any rig, have to be modified to match the
rig's impedance and level output. But after you do
it, the TU will decode much more reliably and it won't
be dependent on the volume control setting, which can
be turned up or down as desired without affecting
copy. Same holds true for the computer sound card
input; a steady input level is always better.

Hello Group,

I'm new member here, callsign is KG4SLM, name is Mark. I was first licensed in March and upgraded to General in May. I'm 41 years old, married for 20 years to Jane. We have two boys, Zachary (13) and Jacob (7). Just recently got interested in Ham radio and I wish I had known how much fun this stuff was 20 years ago. But, anyway, here I am, a "novice" Ham at 41. I recently purchased a TS-850sat from a Ham friend and have been listening only on a long wire strung around the perimeter of my den. I have been amazed by what I've heard, Europe, the Middle East, etc. I'm waiting on the Dacron rope to come in so I can hang a 80 meter horizontal loop and talk as well as listen. In the short time I have been a member of this group, I have already seen that there is a wealth of knowledge here. Does anyone have any recommendations for a good antenna tuner?

73,
Mark

I have the following equipment for sale (I need to clear some space, and help pay for an IC-756Pro II). I will start putting any unsold items on eBay on August 1.

Kenwood TS-850S/AT - I bought this new in 1994 and have used it for my main rig since then. It has INRAD 400-Hz filters in the 8.83-Mhz and 455-kHz IFs, and an INRAD 2.1-kHz filter in the 8.83-MHz IF, and comes with a Kenwood MC-50 microphone and homebrew computer interface (uses Maxim 232 IC, in nice case). The radio, mic, and computer interface are in very good condition, works fine, no scratches or dings, non-smoking environment. With original manuals and original box. $1150 plus shipping

Timewave DSP-59+ audio digital signal processor - I bought this new and it has worked with no problems since. It works very well with the TS-850. Very good condition, works fine, no scratches or dings. With original manual. $125 plus shipping

Electrovoice 641 microphone - A great mic for boatanchors. In very good condition, includes stand with PTT switch, wired with 2-pin microphone connecter (easily rewired if needed). $65 plus shipping

Kenwood R-599A receiver - Good condition, some minor wear, works fine, with photocopy manual. $125 plus shipping

Kenwood TH-215A 2-meter FM HT - Good condition, works fine, with original manual, original charger (original battery is included, but is dead), aftermarket W&W hi-capacity battery and drop-in charger. $80 plus shipping

Radio Shack HTX-202 2-meter FM HT - Very good condition. I bought this new several years ago. Works fine, no scratches or dings, includes original manual, NiCd battery, and charger. $75 plus shipping

Vibroplex Original semiautomatic key - Very good condition, works fine, no dings or scratches. I bought this new in 1988. $70 plus shipping

Realistic Pro-25 scanner - Very good condition, works fine, no dings or scratches. $40 plus shipping

Hewlett-Packard HP41CX calculator, with magnetic card reader, Advantage module, original manuals and boxes, and several additional books on the HP41. $400 plus shipping

All items will be carefully packaged. Payment by USPS money order, PayPal, or personal check (personal checks must clear before shipping).

73,
Jeff Kilgore, KC1MK

Hello Mark and welcome to the group. I have been a member just a short time, but there is a wealth of information to be found on here through other members experiences. I'm running a TS450S in my shack, but I'm saving my pennies for either an 850 or 870. I've been a ham since 1990 and I'm still learning new things about this great hobby every day. I remember when I was 14 and worked a fellow on CB channel 16 LSB. He was only about 10 miles away but I was hooked. I made a pledge to myself to get my amateur licence no matter what, and 12 years later I did! And my wife couldn't be happier HIHI. Anyway, welcome aboard, and if you have any questions, post them and you will get your answers, guaranteed.

Thanks Max,

I discovered this hobby in kind of an unusual way, I guess. I bought a handheld Bearcat scanner to take to the NASCAR race in Talladega so we could listen to the drivers talk to the pits and spotters. After we came home from the race I started playing with the scanner to see what else I could hear. I first put in all the public service freqs and soon got bored with that. Then I found the 2 meter Ham band and heard some guys I know talking about their rigs, antennas, propagation, etc,etc and needless to say I was fascinated. I got my Tech ticket, upgraded to General and am currently studying for the Extra class test. I have much respect for you guys who got their license when the code was much faster than 5wpm and the test was NOT multiple choice. It must've been tough.
Anyway, one of the best things I've found about this hobby is the people. Everyone has been so helpful and this is one newbie who appreciates the help. I do have a degree in electronics and worked as a tech for several years so I understand some of what is going on, but radio is somewhat of a different animal. My first taste at antenna building was a 1/4 wave ground-plane antenna for the scanner which allows me to listen to 2 meter repeaters up to 50 miles away whereas before, I was only picking up local (<20 miles) repeaters. Boy was that satisfying. My wife loves (ha) how it looks hanging from the ceiling by a cup-hook. I do have a 2 meter rig in my pick-up now but not in the house (yet). Please forgive my rambling but I do have a TS-850sat and will need help getting and keeping it on the air.

Mark

Mark, the MFJ,s that I had were not rated for amp useage but that was about 12yrs ago and I just can't recall the model numbers. I was using them on a 80 meter Sky Loop wire antenna and they worked great on 80, 40, 15 & 10. Bet some of the other guys will come up with some more suggestion. MFJ is rather low end but worked good for me.

Mark,
Welcome to Ham Radio! and, a "novice" with a
TS-850??!!

When I was first licensed I was lucky to have a
SX-101A and a one-tube CW transmitter (homebuilt, not
bad looking and it worked), later a Johnson Viking 1
and "slider" vfo (had to keep touching up the tuning
to keep it on a QSO!)... So you are blessed my friend.

The best antenna tuner is "none"!

I really like tuning my antennas so the SWR is 1.5:1
or better on my favorite operating frequecies, then
use the internal AT for the occasional excursion
outside of that range. The 80M loop is a good one,
and if fed with ladder line you can use an EXTERNAL
tuner to make it go on most if not all other HF bands.

You can use the MFJ if you get the KILOWATT rated
models. Don't mess with the so-called "100" or "300"
watt rated ones. They will arc at 100 watts with some
antennas and some freqs. Also the KILOWATT tuners
have larger baluns to go to the open-wire ladder line;
these will easily handle your 100 watts without
causing problems.

Your best bet is a well-built, home brew balanced line
tuner for the loop. I have one if you are interested,
it will tune the loop to 80, 40, 20 and probably
everything else, haven't tried it.

Have fun!

Good prices, Jeff.. good luck on the sale. Sorry to
see you "jump ship" on the 850 though! :)

the 756 pro II is my "dream rig"... which means,
unless we hit the lotto, it's just a dream!

Bill,

Thanks to you and all the guys for making me feel welcome. I was fortunate to be at the right place at the right time for my 850. I helped some guys put up a 140' tower for 15 meters and one of the guys just got back from Dayton with a new Yaesu Mk V Field and needed to move a radio to fund the antenna project. I asked him to give me a couple of days to raise the cash and in the meantime I checked out everything I could find on the internet. eHam.net reviews on this radio were outstanding! I think there was one guy who didn't own one but did use one on field day and didn't like changing the filters via the buttons, other than his review, they were almost all 5/5. A couple of Ham friends said I couldn't go wrong with this as my first HF rig and so far I'm very pleased with the receiver portion anyway. Thanks for the advice on the tuner, if I don't find one in Huntsville, I'll get back with you on yours. And yes, I do feel blessed to have found this hobby where I can solder on something again (strayed away from electronics and got into management) and meet some really nice folks along the way.
ps: Do you guys qso on the bands? If so, which one, what frequency and time?

KG4SLM

Subject: Re: [TS-850_450_690] TUNERS, etc

Mark,
Welcome to Ham Radio! and, a "novice" with a
TS-850??!!

When I was first licensed I was lucky to have a
SX-101A and a one-tube CW transmitter (homebuilt, not
bad looking and it worked), later a Johnson Viking 1
and "slider" vfo (had to keep touching up the tuning
to keep it on a QSO!)... So you are blessed my friend.

The best antenna tuner is "none"!

I really like tuning my antennas so the SWR is 1.5:1
or better on my favorite operating frequecies, then
use the internal AT for the occasional excursion
outside of that range. The 80M loop is a good one,
and if fed with ladder line you can use an EXTERNAL
tuner to make it go on most if not all other HF bands.

You can use the MFJ if you get the KILOWATT rated
models. Don't mess with the so-called "100" or "300"

watt rated ones. They will arc at 100 watts with some
antennas and some freqs. Also the KILOWATT tuners
have larger baluns to go to the open-wire ladder line;
these will easily handle your 100 watts without
causing problems.

Your best bet is a well-built, home brew balanced line
tuner for the loop. I have one if you are interested,
it will tune the loop to 80, 40, 20 and probably
everything else, haven't tried it.

Have fun!

Mark, I too think you made the right decision. While the FT-1000 may be more reliable, the TS-850 has the look and feel that I like and great breakin CW (once you make the CW sidetone level control mod)...

As for freqs, we have no net or anything like that yet, but I try to hang around on 7253.5 Khz during the day (Kaddidlehopper net and Midwest Tfc Net), and 14.060 CW QRP freq. Hook up yer key and give it a try, just send "QRS" if I go too fast for ya!

Jim, fix yer signature! hi hi

I am in process of installing the control wiring for a
screwdriver on the camper, will go on top of the rear
luggage rack at rest and in the front ahead of the
bumper when in motion, so I have to do two wiring
harnesses (coax, plus 2 conductor shielded for 12v).
Phew.. setting up mobile is not easy sometimes.

Where do you guys hang out on HF? Or do you?

# 304. Wider filters for TS450S?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-01 03:23:00 UTC
From: ve3tmt
Topic: 304  Message: 304

In hopes of further tweaking the bandwidth on my TS450 I have bought the INRAD 4 Khz AM filter (8.83 IF) to use as a wide SSB filter, but I still have the 2.4 Khz filter in the 455 Khz IF stage. Is this 2.4 filter going to hamper my efforts by limiting the effectiveness of the wider 4 khz filter? And if so, how do you manage to pull this off in the 850? According to INRAD's website the 450, 850 and 950 all have the same opltional filters available, with the widest SSB filter at 2.8 Khz.

# 305. FS: Reduced: TS-850, etc.

I have the following equipment for sale (I need to clear some space, and help pay for an IC-756Pro II). I will start putting any unsold items on eBay on August 1.

Kenwood TS-850S/AT - I bought this new in 1994 and have used it for my main rig since then. It has INRAD 400-Hz filters in the 8.83-Mhz and 455-kHz IFs, and an INRAD 2.1-kHz filter in the 8.83-MHz IF, and comes with a Kenwood MC-50 microphone and homebrew computer interface (uses Maxim 232 IC, in nice case). The radio, mic, and computer interface are in very good condition, works fine, no scratches or dings, non-smoking environment. With original manuals and original box. $1050 shipped

Timewave DSP-59+ audio digital signal processor - I bought this new and it has worked with no problems since. It works very well with the TS-850. Very good condition, works fine, no scratches or dings. With original manual. $125 shipped

Electrovoice 641 microphone - A great mic for boatanchors. In very good condition, includes stand with PTT switch, wired with 2-pin microphone connecter (easily rewired if needed). $65 shipped

Kenwood R-599A receiver - Good condition, some minor wear, works fine, with photocopy manual. $125 shipped

Kenwood TH-215A 2-meter FM HT - Good condition, works fine, with original manual, original charger (original battery is included, but is dead), aftermarket W&W hi-capacity battery and drop-in charger. $80 shipped

Radio Shack HTX-202 2-meter FM HT - Very good condition. I bought this new several years ago. Works fine, no scratches or dings, includes original manual, NiCd battery, and charger. $75 shipped

Vibroplex Original semiautomatic key - Very good condition, works fine, no dings or scratches. I bought this new in 1988. $75 shipped

Realistic Pro-25 scanner - Very good condition, works fine, no dings or scratches. $40 shipped

Hewlett-Packard HP41CX calculator, with magnetic card reader, Advantage module, original manuals and boxes, and several additional books on the HP41. $400 shipped

All items will be carefully packaged. Payment by USPS money order, PayPal, or personal check (personal checks must clear before shipping).

73,
Jeff Kilgore, KC1MK

# 306. Re: [TS-850_450_690] Wider filters for TS450S?

You are going to have to look at the filter switching,
you may have to switch some control lines around to
get the 4khz filter in on TX.

On the 850 there is a 2nd menu, one item of which
allows you to switch filters during transmit, but
whether that actually switches filters or not I have
not checked out.

I hope to look into this, this weekend.

GENTS keep in mind, with new Yahoo mail format, they
have SWITCHED the "reply" and "delete" buttons! I
have accidently deleted several messages, when I
intended to reply to them. Look before clicking!

In general, I like the new format except for this.
Hard to re-train ole' lizard brain...

Bill,

Take look on item 01, you will can turn ON filters on TX. I hope that help you.

73,
Eduardo - PY2VR
py2vr@...
py2vr@...
www.qsl.net/py2vr

TS-850S Additional Front Panel Functions

Pressing SCAN + TX-M.CH will set the radio into its extended function mode. These options can be scrolled via the M.CH/VFO CH. switch. The following are the extended functions:

00 - This is the ROM C?ecksum displayed as a 4-digit hexadecimal number This cannot be changed.
01 - Allow filter selection in transmit. Initially set OFF.
02 - Antenna tuner power down. Initially set to OFF.
03 - Antenna tuner non-stop mode. When set to on, the antenna tuner will not stop when the lowest VSWR is found. Initially set to OFF.
04 - Store mode, and filter settings prior to changing bands, or c?annels. Initially set to ON.
05 - Display -HELLO- on digitial display, an? send it in Morse code on power up. Initially set OFF.
06 - Turn full LCD display ON on power on. Initially set OFF.
07 - Turn Subtone ON or OFF. Initi?lly set ON. Note t?at even when set off, the TONE indicator will be lit on the display.
08 - Unknown. Initially set OFF.

Is the filter selected by the front panel switches not the filter in
use during TX?

Bill, what I am suggesting may be a cave man approach, but if the optional filters are as accessible as they are on the TS-850, would it not be easier to just probe the filters with a scope or a meter with RF probe and see which ones have a signal present?

Ha, caveman! That's good.

I suppose you could and indeed, I have found bad filters that way... but the easiest way I think is to examine the switching network, and see how they are activated, and also to consider the signal path on tx... do we use both 8.8 and 455 filters on TX? I think not, but am not 100 percent sure.

Of course, we could take the easy route and get on 14,178 Kc or thereabouts, and ask the guys how to do wideband tx on the 850! But that would be cheating I think.

I will be messing with my 850 this weekend, for this very purpose and also to examine an auto-band-antenna switch schema that our friend bud Thompson came up with. He is concerned that as his MBO switches from 80 to 40, that the 80/40 selector relay doesn't chatter, that it stay energized for however long it takes the band select line to settle down again.

I think.

I am just awaiting delivery of my TS450 service manual. I hope to do a little poking around and see what's what filter wise during TX. I had just assumed that whatever filter was selected from the front panel was the one in use. This is certainly not information you can get from an operators manual!

Just for the record, it definitely does switch the transmit filters in the 850. It then also allows you to transmit thru one set of filters, and receive thru another.
You will be able to easily hear the difference in your monitor headphones.

Paul & all,
Although I have switched the transmit filters in my 850 to see if it can be done (and to listen to in the monitor,) I have not made any contacts that way. I am not into this "broadcast-quality" trend, as I feel that SSB audio does not get any better than the crisp, clear response you get with the 2.7 filters. I am also concerned about the bandwidth issue.

However, to each his own. I can easily use the slope tuning on my receiver to attenuate the annoying bass in the "hi-fi" signals. And experimentation is one of the purposes of the service.

I have the following equipment for sale (I need to clear some space, and help pay for an IC-756Pro II). All prices include UPS ground shipping in the continental US. I can can send pictures of any items if needed.

Kenwood TS-850S/AT - I bought this new in 1994 and have used it for my main rig since then. It has INRAD 400-Hz filters in the 8.83-Mhz and 455-kHz IFs, and an INRAD 2.1-kHz filter in the 8.83-MHz IF, and comes with a Kenwood MC-50 microphone, homebrew computer interface (uses Maxim 232 IC, in nice case), and Heild AD-1 adapter for use with Heil headsets. The radio, mic, and computer interface are in very good condition, works fine, no scratches or dings, non-smoking environment. With original manuals and original box. $1000 shipped. I will consider selling these items separately.

Timewave DSP-59+ audio digital signal processor - I bought this new and it has worked with no problems since. It works very well with the TS-850. Very good condition, works fine, no scratches or dings. With original manual. $110 shipped.

Electrovoice 641 microphone - A great mic for boatanchors. In very good condition, includes stand with PTT switch, wired with 2-pin microphone connecter (easily rewired if needed). $6o shipped

Kenwood R-599A receiver - Good condition, some minor wear, works fine, with photocopy manual. $115 shipped.

Kenwood TH-215A 2-meter FM HT - Good condition, works fine, with original manual, original charger (original battery is included, but is dead), aftermarket W&W hi-capacity battery and drop-in charger. $75 shipped

Radio Shack HTX-202 2-meter FM HT - Very good condition. I bought this new several years ago. Works fine, no scratches or dings, includes original manual, NiCd battery, and charger. $75 shipped

Vibroplex Original semiautomatic key - Very good condition, works fine, no dings or scratches. I bought this new in 1988. $70 shipped

Realistic Pro-25 scanner - Very good condition, works fine, no dings or scratches. $35 shipped.

Hewlett-Packard HP41CX calculator, with magnetic card reader, Advantage module, original manuals and boxes, and several additional books on the HP41. $350 shipped.

All items will be carefully packaged and shipped via UPS ground. Payment by USPS money order or personal check (personal checks must clear before shipping).

73,
Jeff Kilgore, KC1MK

hMM, I find the bass on the "hifi" guys' sigs to be
quite refreshing! BUT you have to be very careful
tuning them in. Even the "fine" tuning rate on the
850 is sometimes too fast!

I have a 4x7 coaxial speaker in a Drake MS-4 cabinet
that just sounds awesome with the 850. The SP-230
speaker also sounds wonderful and has tone switches
you can kick in for CW and contesting, and out for
hifi or SWL listening.

Hi All,

I recently "upgraded" from a TS-440S to a TS-850SAT. It was recommended to me highly by many people in the contesting and DXing community as one of the best deals in its price range. It's an excellent radio and I love it!

There does seem to be a small problem with the radio. It has the Kenwood filter for 400 Hz in the 8.83 filter bank. In this position, the "high cut" (smaller inner) knob passes through a "null" at about the 3 o'clock position (pointing right) when turning it counterclockwise from its fully clockwise position. The rest of the range seems to cut the opposite sideband.

This doesn't seem to me to be correct operation. It seems fine on the other filter positions. Does anyone have any experience with this? I can find very little in either the operation manual or the service manual about adjustments of the high/low cut controls. Is there an internal adjustment that needs to be done, or is it a filter problem?

I plan on eventually getting the INRAD filters, at least for 400 Hz CW.

73, Zack W9SZ

Yes, the TS-850 is an upgrade from the TS-440! The
TS-440 still a great rig though.

On the slop tuning, it won't work right with just one
CW filter in, you have to use 2 8.83 and 455

I have confirmed this, I have both K'wood stock
filters, ...kick one out, slop tuning doesn't work
right. Only works with two, preferably same bandwidth
(both 500, both 400 or both 250)

Thanks, Bill. I will see what happens when I get around to buying the INRAD filters. It's not a big problem now, just something I noticed that wasn't optimum.

I'm keeping the TS-440 as a backup rig and for portable use. It's done very well for me.

DEfinitely keep the 440. They are great, until they
start showing all dots on the display, then they are
still great. They just need some TLC at that point.

I bought my TS-440S very cheap because it already had that problem. The previous owner knew how to repair it but never got the time to do so. He's a friend of mine and gave me some documentation on the repair with the rig. I cleaned all the contact cement off the affected boards and replaced a couple parts. I then aligned the VCO circuits. It's been fine ever since.

Is this a problem with the 850?

No, the only known problems with the 850 are an
occasional bad DDS chip, or being zapped into
alligator mode with static or lightning. Neither are
too hard to fix.

OK, that's good to know. I didn't see any of that dreaded glue inside my 850 when I did the mod removing the broadcast band attenuator. By the way, I worked in an electronics repair shop for 10 years and that glue was one of our biggest banes. I repaired an awful lot of equipment that failed because that contact cement was used to glue down various parts.

That's great link, Steve, thanks!

I put an 11 pin socket in for my DC-DC convertor, makes it a lot easier to change. It's 1/2 of a 22 pin dip socket, cut in half.

I am still not sure what causes them to fail, but when they are working, the multivibrator AC waveform doesn't change much from RX to TX. When it's bad, the waveform changes dramatically, both amplitude and frequency or period change quite noticably and the minus 6 volts for the ALC (and other) circuits changes like crazy. At ten bux a piece I am not going to waste time fixing the boards.

# 335. Re: Setting freq on TS-850 (also 450 etc)

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-09 16:06:01 UTC
From: Bill
Topic: 335  Message: 335

Bruce,

I hope you don't mind, I am posting our "setting frequency" exchange to the group for obvious reasons... I don't want to type this more than once, hi!

TC5 is the master freq adj on the PLL unit. REmove the covers, let rig stabilize with temp (I put a dishtowel over mine and let it sit with covers off for about an hour, receive mode). TC 5 is in oblonged shape hole on left side of rig, about 1/2 way back. It is a small trimmer cap; use the proper tool

Set up freq on WWV, 10.0000 mhz showing. Switch back and forth between LSB and USB when WWV is transmitting a tone. Set TC 5 so that the two tones are identical.

For fine adjustment, open up your bandwidth to 6 or 12 khz LSB or USB (doesn't matter). Then, listen carefully for a very low beat note on the tone. Making sure your VFO is exactly on 10.000.00, CAREFULLY adjust TC 5 for zero beat.

I checked mine from cold start (about 65 deg F) to fully warm... started out 20hz low (4.999.98 in my case) and ends up 5.000.00. This is WITHOUT the TCXO.

Close enough for gov't work, no? hi hi

# 336. AM use

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-09 16:18:56 UTC
From: Paul Manuel
Topic: 335  Message: 336

Hi folks!
I am toying with the idea of using the 850 to ragchew with the AM crowd, where I WOULD try the 6kHz filter on transmit. Has anyone used the 850 on AM? What filter(s) did you use? What frequencies are commonly used, and what kind of results do you get?
Thanks for any feedback & 73,
Paul K4PDM

Topic: 335  Message: 337

The 850 configures for wide AM transmit automatically,
just set your carrier to 25-30 watts, and set your mic
gain so it just starts to show on ALC meter, then back
off a bit... You can also use a scope to find your
optimum settings.

If you need more power, use a single 3-500z amp

Hello Paul -
The 850 is supposed to do well on AM but you might want to consider running it into some kind of small linear amplifier to get the output up to a level where you can be heard regularly. AM has noticeably less "talk power" than SSB. I am thinking about getting one of the old Heathkit SB-200 amps for more power on SSB and AM. However, with the older amps there is a problem about the high switching relay voltages necessary that are too much for our modern transceivers. I don't think that the more modern Ameritron amp and its cousins would be a problem. Anyway, since you are in the East I would look at 3,885 in the evenings and also 14,286 in the early evenings. Ten meters has a fair amount of AM activity above 29,000 kHz when its open. I have also heard AM on 160 meters, especially above 1,900 in the winter. Good luck and please let us know how it works for you.

73,
Bruce K6RQR

I have keyed a SB-220 for years with the 850 direct,
no problems. Also have keyed many other amps at least
20 times each, in test, including the Ameritrons,
SB200, a couple of Henrys...

Will do!

To do this, fellow group members, log on to Yahoo groups and navigate to the group, then to "photos" and follow directions. I will put a folder for "member station photos" in there.

We can send them directly to the group as an email attachment, which would be much easier, but also may enable trojan programs to propagate.

Just what I need to see everytime I log on!! Isn't it bad enough I have dreams about the 850!! Not sure what they go for in the US, but up here there is a used one available for $1399 CDN (about $890 US). The 870's and 950's are almost impossible to find up here used. Guess that tells you something about the quality of the radio.

Hmm TS-950...Forgot about that one when I formed the
group and then changed the name... oh well. It's a
pretty rare radio, having been priced out of reach of
many hams, there aren't very many out there, compared
to the 850, FT-1000 and ICOM competition grade rigs.

As for finding a rig, just pray and ask God, he will
get ya one.

I got mine from a ham who advertised it on eham.net. I paid US $ 900 for it. It is in mint condition, not a scratch on it. It has the DRU-2 in it.

I have seen them at hamfests in this area for $750 or so in the past. However, this year of all the hamfests I've been to, I haven't seen one 850. They still seem to be in big demand.

I'm not sure that they are in high demand currently. I've had a TS-850 for sale for a few weeks with no interest at all. If anyone is looking for a TS-850, I have a very nice one with dual INRAD 400-HZ filters, MC-50 mic, and homebrew computer interface that I will make someone a good deal on.

73,
Jeff, KC1MK

Bought mine at R & L Electronics in Hamilton, Ohio a few months ago. They
had two at the time, but the one I didn't buy was in pretty rough shape
(lots of scratches.) They have a warranty, though, if the scratches are
not an issue.

Jeff, I think the problem in selling your rig is filters and mic pushing up the cost. Aren't you asking about $1000? Not that you will never sell it, but it'll probably go quicker if you sell the filters and the mic separately.

Good deal! Shouldn't stay around long. The receiver and quality feel of
the 850 makes it the best deal on the market, in my opinion.

The later serial numbers above 3,000,000 will get you pretty much the latest and greatest, but any 940 in working condition is good. There are a few mods that really need to be done tho, I think I have talked about these in the TS-930 group.

I went through a 930 last week, no major blown parts but it was very close to nuking itself; many bad solder joints on the PA unit where they used rivets as feed thrus, temp changes caused these to shear the solder joints and cause intermittants... the drivers really don't like to work into an open circuit, and they were getting ready to vaporize, i caught it in time. fix involved r&r of pa unit, resolder the rivets, refresh the heat sink compound, change the driver feedback network resistors from 220 to 180 ohms to help stabilize the drivers; r&r filter unit, change r2 to help the fan turn on quicker on the pa unit; change r11 in the avr unit to do the same thing for the power supply fan; rewired the pass transistors on the regulator because the last guy left frayed wires to short out on heat sink; thorough cleaning and lube of controls, blow dust out of everything. lube vfo shaft. hey i'm givin away all my secrets here!

After all is said and done, I don't expect to see that rig back for a long time.

Max,
My advice: before you travel, carry the entire packed radio
equipment bundle into the living room. Sit it down and see if
you can assemble a complete station. Once this exercise is
complete, you will be confident that you left nothing out.
Have fun, 72,
Don Wittlich WN9V

Hi there,

I am looking for even just a photocopy of the schematic for the RF board, and also the PCB plan for the RF board, so that I can locate some chip resistors and caps that need replacing.

I have some serious broadcast band interference and the Kenwood Service Center said that R289 needs to be changed from 10K to 22K, and that a 0.47 cap should be added across C43. Also, to get better static protection, to change D3 to LFB01.

I took a look on the rf board and couldn't find these part location on the board. So that's why I need these plans.

Anybody have the time to send me a scan or a photocopy?

Cheers and thanks in advance.

Herb

are you talking about the ts-850?

because there on the rf board (x44-3120-00) the r289 is 68 ohmns and is on
the tx 3rd mixer

trying to help
kind regards to the group

Thanks for the note. I'm not perfectly sure about the board. I'll call Kenwood and make sure. In the meantime I have received a good quality scan of the boards from a benevolent HAM.

Cheers and I'll let you know.

usual cause for BC band interfeerence on ham bands is
bad or leaky diode on the rf filter for the bc band, i
can check to see which one it is when i get to the
house.

Hi Bill,

That'd be great. I'm accepting all and any help to solve this. Then
I'll have a "perfect" rig.

Cheers, and thanks to others who have responded by e-mails.

Topic: 367  Message: 367

Hello everyone,

Just got back from my mini-vacation up north. Spent a few days on the lake at my brother-in-laws place. Fired up the TS450 and 20m dipole and WOW! No noise, just signals signals and more signals. What a difference from living in the city. Took the rig out on the deck and spent the day in the sun making QSO after QSO! That was the life,

# 368. TS450 bat change?

Yahoo group: TS-850_450_690 (2001 — 2005)

I have had a look through N6TR's web page
(http://n6tr.jzap.com/850BAT.html) about battery change in the
TS850. Is the proceedure and battery type much the same for the
TS450? Just figured I would ask before tearing into the rig,
which I plan to do once I get home from Oregon.

BTW I just joined the list. Have had a TS450 since 1994. Very
happy with the radio. Only complaint is the battery thing.

Check D16 and D17 on the rf unit for leakage, use DVM
with "diode test" function, should read about .7 volts
one way, and more than 1-2 volts the other. These are
RLS135 type diodes, a 1s1587 will also work, oriented
properly.

We often operate in the back country here in Colorado,
and sometimes you can't tell when you hook up the
antenna, it's so quiet!

Larry, be very careful when doing this, the battery
leads are thru-hole types rather than lap-soldered or
connected to vertical pins as on the other rigs. Make
sure 12v is disconnected from the rig, as well as all
other connections including ground, if your solder
iron is grounded it will cause all kinds of problems
if the rig is also at earth.

# 372. Re: Looking for RF board schematic and PCB plans ... photocopy okay

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-20 04:16:52 UTC
From: ve7azc
Topic: 362  Message: 372

Hi Bill,

BINGO!

D15 is okay, but D16 measures 146mV in both directions. Of course this was done without lifting one side from the board. Man that stuff is tiny ... I had the ultra geek 2000 magnifier headset on (complete with lights for the extra geek points, my nephew is convinced I'm from Mars). All the other diodes checked at 683mV one way and infinite the other way when attached to the board. I also checked out R289 and it is shorted. D1 is also measuring out as suspicious at 285mV in each direction.

A close look shows that Kenwood has pre-glued each of these diodes to the board prior to soldering. I'll have to wick away the old solder verrrrry carefully with the iron on low, and then figure out a non-destructuve method of removing the old glue. I think I'll get a few extra parts and practice this on an old PCB before I attempt it on the real thing.

Any tips?

H

# 373. Re: [TS-850_450_690] Re: Looking for RF board schematic and PCB plans ... photocopy okay

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-20 12:46:05 UTC
From: Bill
Topic: 362  Message: 373

do NOT use low power! use 25w minimum, wick both
sides of the diode, and then heat one end as you
carefully work it sideways with a slight, gentle twist
off the glue. it will come right off. notice first
which end is banded; that is the cathode.

I would change only D16; some of the other diodes
measure low both ways as designed. Do one at a time.

The other one that sometimes goes with lightning is
D31, another RLS35, but that has different symptoms
than yours.

Tell your nephew your "geekiness" will save you about
$149.00 US.

# 374. TS-850S Backlight

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-20 13:28:57 UTC
From: Jim ve3mij
Topic: 374  Message: 374

Ahh.. Been silently enjoying the tech tips and pleased that my 850's been trouble free for 11 years or so.

However, one thing I've been curious about for all that time...

Sometimes, the backlight on the LCD doesn't come on for a period of time, when first powered up. This could be from a second to 20 seconds on the rare occasion, but I've often wondered if there is cause for concern.

Is this normal?

Thanks all,

Jim VE3MIJ

I suspect that the dc-ac converter for the fluorescent
backlight is not turning on, may also be temp
sensitive. I would replace it.

Thanks Bill,

It seems like it's slow to start, but always does. I've had the problem(?) for about 9 years now, and once it comes up, it never goes off... Sounds like it's not a common problem though!

As long as I'm not in a rush to read the display, it hasn't been a issue. Fortunately, it's occasional, most of the time it comes up immediately.

I seem to remember the inverter is a sealed unit. Don't suppose you've ever had one open?

Jim

Topic: 362  Message: 377

Hi again Bill,

Problem solved! It was D16, which was suprisingly easy to replace. I wicked out the old solder with very fine wick and re-used the "saddle" of glue left by the old diode to seat the new one. Soldered it in lickty-split. BC interference gone.

Bill, thank you very much for this assistance, and to Oliver Remaly Jr. (WD0ALW) for e-mailing me en excellent quality scan of the rf board. Also thanks to the others who e-mailed me their assistance.

Cheers and good DX.

Herb ... geek extra-ordinaire!

Yes it is sealed. Should have 28kHz signal, 300v p-p,
except when dimmer circuit is active, then it pulses
the 300v on and off. Could be dirty or bad dimmer
switch on front panel... clean it first, then check
around the inverter circuit for bad solder joints.

300v will give you quite a kick!

Date: 2002-08-20 23:54:49 UTC
From: Bill
Topic: 374  Message: 379

Yes it is sealed. Should have 28kHz signal, 300v p-p,
except when dimmer circuit is active, then it pulses
the 300v on and off. Could be dirty or bad dimmer
switch on front panel... clean it first, then check
around the inverter circuit for bad solder joints.

300v will give you quite a kick!

Yes it is sealed. Should have 28kHz signal, 300v p-p,
except when dimmer circuit is active, then it pulses
the 300v on and off. Could be dirty or bad dimmer
switch on front panel... clean it first, then check
around the inverter circuit for bad solder joints.

300v will give you quite a kick! I prefer a scope,
having tried the "wet finger" approach already.

Thanks Bill, You're always a wealth of information...

I found out many years ago what 400vdc feels like... When I came to, 10 feet from the bench, looking up at the ceiling and my screwdriver, stuck in the tile, I was happy I had one hand in my back pocket.... Old TV repairman trick!

So I'll use the scope... Got lots to pick from as I work for a company out of Oregon that makes them.

From the overwhelming response (hi) I see my 850's unique in this regard!

Jim

Maybe this has been covered, but, quoting from the manual:
"When switching on the power after a prolonged period of non-use, several seconds may pass before indicators appear on the display. This is normal operation."--pg. 10.
Again, maybe 20 seconds is too long, but I just wanted to bring this up.

Hey thanks Paul... Read The Fine Manual!

It's been a while since I did. Initially, I never saw the "event", but when I first got the rig, you couldn't pry me off it!

Makes perfect sense.

I'll just watch it, and if it degrades over time, I'll start measuring. Something new for the log book.

- Aug 21, Powered on 850, took 7 seconds for display to illuminate.
- Aug 22, Powered on 850, took 1 second for display to illuminate. (Really should use it more!)

73, Jim

# 393. TS-850sat ATU problems!

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-27 08:06:22 UTC
From: mm0tkl
Topic: 393  Message: 393

Hi everyone,

I've recently purchased a secondhand TS-850sat in excellent condition, but have a problem with the ATU. The Rx works fine, but the Tx only works if the ATU is out of circuit. When the ATU is in circuit and is activated, it makes all the right noises as if it's trying to tune, but the SWR meter reads infinity permanently and the tuner times out without a match on any band and this is into a dummy load! I have no reason to doubt the previous owner when he says it was working when the radio left him and has possibly taken a knock in transit. I don't have the full circuit diagram and only a digital multimeter to help me track down this problem. So, if any of you knowledgable people out there have had this problem before, or know what my problem is, I would be very pleased to hear from you.

Thanks in advance.

John.

# 395. Re: TS-850sat ATU problems!

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-27 14:17:59 UTC
From: mm0tkl
Topic: 393  Message: 395

Further to my last message, I have now taken the lids off and have done the following :-

1. Removed the ATU and the radio works fine.

2. Checked out the continuity of the input and output leads of the ATU and they check out fine right through to the change over relay on the ATU.

3. The route from the relay above through to the tuning capacitors checks out OK.

4. Slowly coming to the conclusion that this fault isn't as obvious as I thought it would be to find!

It looks like it could be the sensing circuit that's not seeing the load on the ATU.

Any ideas please?

Regards,

John.

Take a look at the relay that puts the at unit in
line. you could also have one relay that is stuck
"ON", there is a way to find this.

the tuner in the ts850 is a twin "t" design. Relays
in the tuner ground part of the inductance for each
band. One relay should actuate per band. Way to
check? Lift the end of the last largest toroid coil
from ground. Check the large air wound coil with
ohmmeter... if it still shows ground, you may have a
relay stuck shut.

# 399. Coax suggestion?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-28 03:14:33 UTC
From: ve3tmt
Topic: 399  Message: 399

I have been experimenting with a homemade HF loop, and am having troubles matching it. I have a high power variable cap on the way from Henry Radio, and have been experimenting with a coax matching stub. I can get the thing to resonate to a 1:1 swr, however after prolonged TX, the coax begins to burn on the end. I have even tried RG213 which is supposed to be good for 4KV. Am I doing something wrong?

Thanks,

Max

# 400. TS-850sat SWR problems.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-28 09:26:36 UTC
From: mm0tkl
Topic: 400  Message: 400

My apologies to everyone, especially Bill, but it looks like information I gave earlier was incorrect...

As a new owner to this radio I wasn't fully aware of it metering abilities and did not have the meter switched to SWR initially when I did the first tests and so gave a false diagnoses. The fault is the same with or without the tuner in circuit and that is the meter shows permanent infinity SWR when transmitting into an antenna or dummy load and I think this is the reason why the tuner can't tune any load that's presented. This high SWR reading is being sent back the tuner stopping it from doing its job. It looks like a Stockton bridge type of SWR detector circuit on the filter unit and I've checked the inductors, the two diodes and the tracks between the input and output sockets on the board with my multimeter and everything looks fine. It still looks like the transmitter is not seeing a load at all, but doing continuity checks, it all checks out right through to the antenna socket!

Thanks in advance.

John.

Max -

What band(s) are you trying to use with it?

What is the total length of the wire in the loop?

Where are you placing the coax matching stub and how long is it.

How much power are you using to the coax?

Are you trying to match the coax to the loop, or your transmitter to the coax?

bud N0IA

I am trying to make a capacitor out of a piece of
coax. I figure the voltages must be too high, which is
what is causing the arcing at the end. The loop is
tuned to 14.200. I hope to run 100W through it, but
after about 25W the arcing starts. I probably need a
vacuum variable, but they are so expensive.

H9i there,

I have had good success matching a full wave loop by using a 1/4 wave stub made of good quality 75ohm co-axe. I think last time I used RG-11, which is the same diameter as RG-213. Of course, the 1/4 wave must be multiplied by the velocity factor of the cable, usually around 0.86 or so.

This provided a good match to the 50 ohm RG-213 which ran into the shack. No problems, full power out, fairly good bandwidth, quiet, no arcing at legal limit, about 3db gain in send and receive ... get it as high as possible. Lots of info on Cebik's pages, as well as in the ARRL handbook.

Cheers,

H

If it's a full wave loop, the feedpoint impedance will
be about 105 ohms. Try a matching stub of RG11 75 ohm
coax, 1/4 wavelength (electrical) long. For 20M that
should be about 10.5'. Use an insulater for the
connection, not a balun.

If it's a short loop, you will have very low
impedances to deal with, with high circulating
currents to heat things up.

I guess I should have been more specific. The loop is
a small hf loop similar to the Isoloops and the MFJ's.
I have a small capacitor now that will resonate the
loop anywhere from 40-17m but the plate spacing is too
narrow and anything over 25W causes it to arc. I was
trying to make a capacitor out of coax hoping to be
able to get a bit more power to the antenna. But even
with RG213, 50W will cause the coax to arc at the open
end. Plenty of voltage there, that's for sure. Perhaps
it is impossible to use a coax stub? I had a vacuum
variable, but the loop fell over and smashed. I'm
sure the neighbours heard my screams! Any other suggestions?

Try stripping the ground shield back an inch from the
end.

Try making your own hi-v cap, with some brass sheet
and threaded stock and nuts... should not need much
capacitance, with that high impedance.

I have a real high voltage, low cap varicap if you
want to try it.

Did the strip thing Bill, it arcs right through. I believe that the value is around 20-30 pf.

# 411. Fluctuating power output - once again

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-08-29 23:07:16 UTC
From: ve7avv
Topic: 411  Message: 411

I believe I know the answer to this question, but I'd like to poll the collective wisdom of the group for confirmation. After very heavy use in a recent contest one of my 850' has what I think is a failing DC-DC board -- again. Here are the symptoms:

Keying the radio (with the meter in the ALC position) I notice the ALC go high at about the same time as the output power suddenly drops to zero and then a few seconds later, ALC drops to normal as power output returns to normal. The ALC level appears to fluctuate in sync but in the opposite direction with the output power. Funny thing is, the radio will act normal and then without warning go to the state as described above. In all observations of this problem, the rig is driving a perfectly matched load (near-zero reflected power). All symptoms appear identical to those experienced prior to the last failure of this small board.

In speaking with the Canadian Kenwood repair centre, I'm lead to believe the replacement X59-1100-00 DC-DC Converter board has parts that are an upgrade from original stock parts. Apparently Kenwood was aware of component failure due to heat on this particular board. I believe heat is still a prime factor for this component failing.

As always, the thoughts and comments from the group would be much appreciated.

Paul, just replace the board.

I put in 1/2 of a 22 pin IC socket in first, for 11
pins, so I can easily change this board in the future,
or test other boards for failure.

Hi Jim,

Just wanted to welcome you to the group, and a fantastic one at that. Lots of helpful people here. I recently picked up a TS850 from another member here and just love it. My TS450 has now been relegated to field day use! I am unable to erect any kind of sizeable antennas, so I must run barefoot with wire antennas as well. Your accomplishments are to be applauded. Don't hesitate to ask any questions, there are always lots here to offer valuable information.

73,
Max (station pic is in the photos section of group)

# 422. New Co-moderator Max, VE3TMT!!!

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-09-16 23:32:27 UTC
From: Bill Leahy
Topic: 422  Message: 422

I would like to introduce Max, VE3TMT, as our NEW CO-MODERATOR!!!

<applause>

<more applause>

<standing ovation>

<people start throwing roses, cash and bus tokens onstage> (just kidding)

Thanks Max!

Max will be able to approve new members (and give that oft-neglected "new member" welcome message that everyone just LOVES to get), approve messages from members that are on "moderate" status (currently, none), and (God forbid!) ban members and so forth.

Please go easy on him! It's not easy being moderator, especially since Yahoo changed everything around. Don't worry, we will have some training on navigating Yahoo's oh-so-intuitive (NOT) moderator tools.

Max, thanks again! If your inbox fills with kudos, blame me...

73!
Bill K0ZL

# 423. Re: New Co-moderator Max, VE3TMT!!!

Yahoo group: TS-850_450_690 (2001 — 2005)

From: VE3TMT
Topic: 422  Message: 423

Hi Bill and members

Hopefully you will all go easy on me except the part about throwing money. Please the more, the better! Bill, I will be sure to let you know what questions I may have so don't be surprised if it is your mailbox that fills up!

I'd still like to see some photos from our other members. I always get new ideas on how to set up the shack by seeing how other ops do it. Hopefully you guys do too! I came across a great way for making my shelves adjustable (see my photo) using threaded rod and hex nuts and washers. I have since added my S-Com processor back into the audio lineup below the 850. By adjusting the shelf height using the hex nuts everything fits nice and snug. But I am running out of room, as the 850 takes a good portion of the available space.

I hope I fulfill the needs of the group as co-moderator and please let me know if I need improving in any area. Gosh, this sounds like a job interview doesn't it?

Max

# 424. New poll for TS-850_450_690

Yahoo group: TS-850_450_690 (2001 — 2005)

Topic: 435  Message: 436

Jim I suspect that your reverse VSWR detection diode
is bad.

Access the VSF and VSR signals on connector 8 on the
filter unit. at low power setting into open antenna,
these voltages should be about the same, on the order
of a volt or two at 5-10 watts setting. If VSF is
much greater than VSF, D9 is bad. It is a 1SS101
Shottky type diode, which I have here if you need
some.

The AGC time constant is one of those things that can
make your radio wonderful or a dog to listen to! I
remember playing with every radio I've ever had, from
National NC-300 to Yaesu FT-101 until I got the AGC
"right". The only ones I didn't have to mess with
were the Drakes and the '850!

Hi there,

Thanks for the interest. The quad is rare bird built by W2AU, but the parts are top notch quality. It is very similar to the lightning bolt and Cubex quads. The arms a tapered hollow fiberglass with re-enforcing where the wires pass through them. The hubs are cast aluminum, real tough. The boom is 2" aluminum tube.

The directions supplied with the quad (which I purchased used for $200) indicate a common feed point using a 1:1 balun, plenty of which are available. I've read many books on separate feeds for the three bands, but I just am not that fussy. There is a very good match on the three bands using the standard equations (1005/F). I have run full legal into it with no problems. I DID have to make a coil of co-ax ( five turns 8" diameter) to decouple the antenna from the feed line due to RF at QRO levels. The reflector loops are 2% bigger than the driven elements.

The main difference from my other antennas, other than the gain, is the utter quietness of the quad. At first the band seemed dead, and then whamo ... big sigs!.

It is a very light antenna (total weight about 30lb) with a wind load of less than 4 square feet. The only problem is assembling the thing. I preassembled the elements in the back yard and then hoisted them individually onto the boom with a light rope. It's very BIG in the air ... not flat like a yagi. the boom is only 8 feet long, so in the air assembly is not too bad if you're careful.

Due to it's quietness, I often use it to monitor on 80m.

The from to side is good, but the f/b is not as good as a yagi I think. I have it at 40 feet boom height.

Glad to see others are still interested in this type of antenna. I'm sold on loops for their quietness and low angle.

Cheers,
Herb

Thanks Herb.

I was particularly interested in the feed point
arrangement, since I know that loop are about 105 ohms
(I don't know their char. impedance when in proximity
to a reflector however).

I am looking at the Lightning Bolt 2 element, as I
would like all 5 bands, and don't need a lot of gain
as I can run 400w if needed.

Hi Group,

Wow, its great to see the excitement about a radio that hasn't been in production for quite some time.

I'm just picked up a new (old) ts450s and would like to find a DSP 100 digital unit for it. I know not many of them were sold, but would like your help in possibly finding one. If you can help, drop me a note.

On 20 meters during a contesting situation.... On recieve on a loaded band, i'm hearing images of other 20 meters phone signals. For example with a strong phone station operating on 14.220 I might hear him in a disorted manner on 14.320 etc.....I have noted the lightning arrestor has been
blown (its pretty darn yellow) some have indicated that the blown arrestor itself may cause the rx. malady.

The tx sounds fine, the rx. sens. seems to be just fine, and I could not duplicate this with other strong signals on other bands (although it was hard to test)

Have you ever heard of this before? Do you think the problem has gone further in the many diodes which follow?

Comments/Suggestions?

Rick
ve7cjq

You are going the right way in seeking an original
service manual, Art. Photocopies these days are
nearly useless (if black and white... I should think
color copies would not be cost-effective).

I should think that the 450 manuals are still
available from Kenwood/PacCoastParts/EastCoastParts?

The spark arrestor (DSA301LA, from PacCoastParts or Icom, about 8 bux) should not affect things, but you do want to replace it ASAP. I do mine about every year, since I put the 1 mH choke across it, it lasts about that long (instead of 3-6 months as before).

If you can't duplicate the image problem on other strong sigs, chances are, it was with that guy's transmitter.

Get in the habit of turning your AIP ON. This shuts off the preamp and bypasses it and will increase your third-order intercept point and keep a lot of distortion from happening. Also leave your noise blanker off and when using it, turn NB level to minimum. You can also use your 6 or 12 db att switch if you need it.

Hello all!

My name is Dennis Ls. M. Cruz and I'm from the Philippines. I believe some of you are familiar with me since I also joined the groups for IC-R75, IC-718, VR-500, SuperadioIII, TS-440, etc. I joined this group more than 3 weeks ago but took the time to read all the postings and compile all important points and discussion in a Word doc format like what I also did to the TS-440 postings. Anyway I am here to learn in advance about this great radio - the radio that I'm dreaming to get one in the near future when one of this units would show up on my dealers place. There are very few TS-850 users here in the Philippines, most are using the TS-430 & 440. Anyway, I shall be postings some questions soon. Hope everyone can assist me in my quest for the best information about the Kenwood TS-850 and other radios.

Dennis (stclaire@...)
island of Bohol (09 deg 38' North 123 deg 52' East -8:00 UTC),

Folks,

some months ago I bought a DRU-2 to my TS870 but it
doesn?t fit. So I am selling it for US$ 65,00 in a
mint condition.

Tks

The DRU-2 is to TS-450/850 only. For 870 you must use DRU-3.

Subject: New member from the Philippines

Oct. 15, 2002

Hello all!

My name is Dennis Ls. M. Cruz and I'm from the Philippines. I believe some of you are familiar with me since I also joined the groups for IC-R75, IC-718, VR-500, SuperadioIII, TS-440, etc. I joined this group more than 3 weeks ago but took the time to read all the postings and compile all important points and discussion in a Word doc format like what I also did to the TS-440 postings. Anyway I am here to learn in advance about this great radio - the radio that I'm dreaming to get one in the near future when one of this units would show up on my dealers place. There are very few TS-850 users here in the Philippines, most are using the TS-430 & 440. Anyway, I shall be postings some questions soon. Hope everyone can assist me in my quest for the best information about the Kenwood TS-850 and other radios.

Dennis (stclaire@...)

Hi Dennis

Feel free to post your file on the "files" section of the group if you want. Might save someone from having to go through all the posts which can be quite tedious.

Thanks for contributing Dennis, we are looking forward to hearing how you and your friends are doing there.

# 467. Problems with a KWD TS-850s

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-10-17 13:39:51 UTC
From: vo1gw_2002
Topic: 467  Message: 467

For a while now, I have had trouble with my TS-850. When I first turn the rig on,
within 5-10 minutes my receive audio become very distorted. At the same
time, if I transmit, I have been told my transmit signal sounds distorted as well.
This seems to last only up to 5-10 minutes then disappears and the rig works fine
from then on. I have tried another rig on my powersupply at the same time and it works
fine, so I guess the powersupply is not the problem. Since the receive and transmit signals
are affected I don't think it's RF. I am not very technically enclined so don't have too many
ideas of what is causing this. Any thoughts would be appreciated.

Thanks.

George - (VO1GW).

Hi George.. It's a DDS unit problem. You will have to
determine which of the four chips is bad on the DDS
unit using a hair dryer, or replace the entire DDS
unit board.

Any one got the TS850S manual in pdf? Or the last pages in the service manual think its 117 onwards.

I have the original manuals one with English and one with other languages but I like to have the manuals on my pc as well.

Its just a little thing I do
I have manuals for different radios and antennas I have or used over the years if you want me to list them just ask and I will.

Any help would be great. That reminds me I need to get my other radio the TS850 repaired

Will get around to it one of these days. Probably shouldn't have bought a new radio then I would have sorted or got it sorted.

Topic: 472  Message: 474

It stopped txing last year in cww ssb contest. If you can mind you gave me a few things to try out but I never got around to try it yet. I had just moved into new house and all the stuff that goes with it.
I took the easy option and bought a new radio in the hope I would get the 850 sorted when I have time. My electronically expertise is none hence the reluctance of trying to repair something I don't know. But I will try what you suggested when I have the courage to do so hihi.

this is what I think I narrowed it down to---------CAR UNIT
x50-3140-00 next to the dds ic`s. In front of ic4 a small can on top of a plastic bottom looks like the culprit and also has some melted plastic at the bottom it is marked 47 16v and I think it is an electrolyte of some sort think it may be C1 the positive side goes to IC8 which is a voltage reg AN78N05 could this cause my problems?

And you gave me this to try which I haven't yet but I hope to soon as I miss the 850 in the shack

look at the IF unit, find the pads for r8v and t8v.
They could be labelled R8 and T8, not sure. They should
switch cleaning from rx to tx mode. If not, I will
tell you what to change. R31 on the RF unit would be
my first choice, it is an RLS35 and they are notorious
for going leaky, which keeps your tx line bias "on"
during receive. This really confuses the radio!

the RLS35 is a cylindrical, smd pin switch diode, very
small, about 1/4" long and 1/16" dia, there are
several on that board. A 1S1587 can be substituted if
you are careful soldering the leads to the board.

Is this different from simply going to the Yahoo Groups webpage and browsing through all the messages that way? It also can sort messages by thread and you can browse up and down the thread that way. The only downside is that you get the dreadful pop-up, pop-under and banner ads.

Hello Stu,

I have the TS-850S Service Manual in a .pdf file and
can email it to you if you can handle so large a file.

I should upload it to the files section of the group I
suppose ...

It is also available at:

http://hamradio.online.ru/sch_eng.html

# 483. TS-850 vs. IC-765

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-10-18 22:11:38 UTC
From: dmcbohol
Topic: 483  Message: 483

Oct. 19, 2002

Hello and here is my first question:

The dealer where I got my TS-440 had recently acquired a used Icom IC-765 for another customer. When he did the on-air test, I was impressed by the audio quality and signal strength from my QTH more than 632 kms away (not very far really). I looked at the Yahoo Groups and there is no eGroups for the IC-765 yet. So I would like to ask members here who own both the TS-850 and the IC-765: Which one in your opinion is the better radio both receive, transmit, features & repair history?

Your feedback (both negative and positive) will greatly help me decide which of the 2 will be my second/main rig to compliment the TS-440 I already have. By the way, both radios are NOT easily available here. The dealer will have to locate one from Japan or there in U.S. I cannot afford to buy both radios, so I have to decide which of the 2 to get.

Many thanks to all!

Dennis (stclaire@...)

From: Bill
Topic: 483  Message: 485

Dennis I would go with the 850, for several reasons

the 765 uses an internal switcher power supply which
is obsolete. If you are good at fixing switcher power
supplies this would not be a problem.

You can use an external PS with the 765 if the
internal supply fails.

The 850 is later generation, and more parts are
available. It is also somewhat smaller which is
important to those of use that are desk-top challenged
these days.

Hi George,

Not sure if this was the problem, but on any memory
battery change, it's a good idea to cycle the rig on
then off again to make sure the CPUs go into "sleep"
mode properly. Sometimes when you pull the battery,
it "forgets" that it's supposed to be "off".

Also... make sure you got the battery polarity
correct. This is so dumb to even mention, but I do
because I HAVE PUT 'EM IN BACKWARDS (Mr. Technician,
right?) hi hi

Also.. make sure your solder iron is grounded and YOUR
RIG IS NOT. If both are grounded, when you solder the
+ lead, your iron will ground out the battery and
greatly shorten or eliminate it's life.

One other thing, guys... gals... wear some sort of
safety glasses or goggles when changing batteries. I
have had them pop and spray stuff when heated,
especially the older ones.

73!

hello all

several years back, "the radio doctor" made a video about servicing the TS450. They are no longer available but I'm wondering if:

- anyone has seen one of these and what they thought of it

-is anyone willing to part with their copy.

Larry VE7LFN

I had one for the 430 and it was very basic. The quality was so-so and I guess it was better than nothing but if you were doing anything "major" it would have been of no help at all.

Funny you should mention this, I just had a memory battery go
dead the same way on a TS-450. I put a new battery in and it seemed
to work fine. Less than a week later, it was dead. Using 3V power
supply and a Fluke DMM in series with the battery input feeds, I
measured no current draw when the rig was powered up (good) and 2 mA
when the rig was turned off (very bad).
At 2 mA, the lithium battery will drain completely in about 6
days which was about how long this new battery lasted. I beleive the
current draw should be closer to 2-3 microamps which would make the
battery last about 10+ years (a much better estimate).

I measured the DC resistance between the battery terminals and
saw 1.38M which calculates to about a 2 uA draw (I know the diode is
in there which can foul things up, but I didn measure anywhere near as
low as 1.5K Ohms. I was thinking it may be one of the two capacitors
between the battery and the RAM chip that went resistive.
In the mean time, I have a pair of AA alkaline batteries in a
holder tie wrapped to the back of the set. That will last at least 2
months before I have to tackle this again, unless I find the cure
sooner. The parts aren't hard to replace or buy, I just want to know
if there is an alternative before I open the rig up again.

So you're saying Bill, that after putting a new memory battery
into the set, cycling the power will let the CPU know it's supposed to
go off? I guess I can try that first with the external power supply
and ammeter to make sure it works.

Roy this is very interesting and the first that I have
heard of this type of thing.

You may have either a cap as you say(they are large
capacity units and indeed, could go leaky) or a CPU
that won't go to sleep. Would be interesting to know
where that current is going! Sounds like you are up
to the task of finding out.

If you want to try a little surgery, break the trace
going to the VDD pin from the battery, after the caps,
and measure current there.. that will tell you for
sure where it's going. Or, remove all caps
temporarily.

OK I'll try that after I try your On-Off test while measuring the current. The problem I see with the On-off theory is that there is a blocking diode that prevents the battery from powering anything else on the digital board. So if the power switch is turned off and/or the 12VDC cord is disconnected, the CPU will not be working and cannot be reading/writing to the RAM causing excess current draw.

Oh well, I'll eventually try it out and I will certainly let you know what i discover. There are a lot of cables and harnesses going to that digital board and it takes a bit of room to comfortably spread everything out and finding the room is more of the challange for me <g>. Fortunately, Kenwood laid everything out in the 450 so that there is very little chance of miswiring anything when you put it all back together.

The CPU is not off, it's asleep when the power is off.
Or it's supposed to be.

Hello group !

I finally posted the first edition of the compilation for postings done for our group. You can find it in the files section. I forgot to check "send a message to the group..." so I have to anounce this "manually". I never got the chance to run a spelling check since my MS Word is not properly running - it will stop checking spelling after only a few sentence. I shall have to reinstall it again.

I shall periodically update it as we progress. I hope you'll find it informative. Any comments, both negative and positive is much welcome so I know where to improve this note/guide.

Hi,

Does Kenwood have an HF rig which has 6m and 2m on it too (like IC-746 or IC-706)?

I've been doing some research and it seems only ICOM and Yaesu has this model.

Thanks

Dennis (stclaire@...)

Topic: 504  Message: 507

Mike, you can use the OPC24 (?) from Icom, or the kenwood cord. I like the Icom cord the best, it's a little heavier I think. Also the new Yaesu cord works with Kenwood... Believe it or not, they finally standardized!

It really doesn't pay to build your own, the opc24 is about 27 bux but has heavy duty everthing.

Spray a little cleaner in the radio connector; these get a little oxidized and they will over heat on rtty/am/fm modes sometimes.

Hi:

I checked and I think the The Kenwood TS-2000 is an HF/6m/2m/70cm all mode transceiver. Hope this is of some use.

73, George.

Oct. 26, 2002

Hi again !

Is there anything less sofisticated than the TS2000? Actually, what I should be saying is, will I be much better (& cheaper) buying a separate VHF/UHF transceiver rig than getting an all-in-one radio like the IC-746, 706, TS2000, FT100, etc? If so, can someone in the group recommend me a good (used/2nd hand) and reliable VHF & UHF transceiver rig, be it Kenwood, Icom or Yaesu. I'm trying to avoid new/latest models because I might have a hard time getting it repaired here if it breaks down.

This is a bit off topic so my apologies. Thanks in advance.

Dennis,

If you don't mind separate rigs, the Kenwood TS711/811 combo is a
very good sounding radio.

Max

Dennis, here are my opinions for what they are worth.

Get an "all in one" radio if you are "space challenged", as many of us are. One box is a lot easier to "sell" to the XYL than two or three and all the attendant wiring.

In my experience, the TS-2000 will not need service any more (or less) than the other radios that you mention.

On the down side, if one part of the radio quits, you have to basically send in your entire station to get it fixed! But hopefully with the proper care and a GOOD line filter, that won't happen very often.

I think the newer radios AS A RULE are more reliable than the older ones, except where static susceptibility is concerned. I tend to see more SMD devices damaged by static discharge, than the older discrete components in the older rigs. Exceptions would be the TS-440S and the FT-757 (all models), which are lightning attractors and fail frequently with nearby thunder-hits.

I have dealt with the IC-706 and the FT-100, and my money would be on the FT-100 simply because of serviceability issues. I won't work on the IC-706, it's too hard to get to all the modules for t'shooting.

There are many of both kinds 'on the road' and the owners universally love them.

If you have a choice, buy the rig that has the closest factory service shop, unless you or someone else would like to become the technical "guru" in your area.

Dennis you sound like you could become that guru, and thus solve the "no service facilities here" problem, plus make enough money to support your hobby.

73!

Topic: 513  Message: 513

Hello Om,

My ts850 went silent key, in the middle of the cwqww contest last
weekend.
I had no output, and a nasty smell came in my shack...
After some inspections I saw that the final transistors were ok.
This evening I found that transistor Q152 on the TRX X59-3680-00
board burned out.

- Does any has experiences with this?
- How can this happen, while I feel myself not guilty doing something
wrong.
- Is it possible to swapped this transistor or do I have to swapped
this tiny PCB at all.
And swapping this transitor is this the solution ?
It's a small board what is soldered vertically on the IF Unit.
Looks to me it is not easy.
Please help me out,
73s Peter PA3FNE

You should be able to change this out without removing
the auxilliary board, I think it is on the SS line to
make the rig transmit. I will look at the SvcMan
tonight to see what you are dealing with.

It's nothing you did most likely, maybe a spike off
the t/r line from the amplifier?

Hi all I hope somebody can advice me with a problem I have. I have built a rs232 interface for my ts850sat and had it working, on the bench, both ways. I then fitted it in to a box, checking the wireing as I went along when I turned it on the programme [n1mm logger] connected with the radio and showed the correct info and that was all i could get no more control or info between the two. ON testing it seems I can see the computer output but i am not getting anything from the radio, all I get is a +5v signal on the tdx line but no signal
Thanks Dave M0BZK

Hello Bill,
I had to built out the IF-unit board, and I'am sure that the Q152 is
the smoking bandit.
I will let you know, when the unit is fixed.
First I have to order the transistor, and secondly build the TS850
together.
But this will take some time, while I have travel to France coming
weeks.

The MFJ-5383K is only $49 if you're not sure about the interface you built.

I built one that's a Max232 and optocouplers and bought one from MFJ. (The Kenwood price was absolutely insane for what's inside it.) They both work and I'm not sure the time invested in building one was worth the 10-20 bucks saved. Unless you did it for fun, then that's completely different!

Check obvious things like ground and supply conflicts. The Kenwood interface is designed with optocouplers (opto-isolators, whichever turns your crank) that completely isolate your PC electrically from the rig. If you did a design like this, take a look to see if you created a supply or ground connection that is unnecessary or undesirable when you boxed it.

Don't know if this helps, but just a thought...

That is a 2SA1204(y) on the TRX unit supplying TXB to
the rest of the rig.

Also check Q3 on the BK SW unit, which I have circled
as a common cause of SS being locked LOW or ON as if
the mic were keyed all the time. It is a DTC124EK
compound transistor and is on the "X59-3880-00" unit.

Good luck Peter!

remember that the standard for the rs-232 is voltage about +12 volts to -12 volts, then if you conect the radio with out coupling the +-12 volts to the +5volts TTL on the radio , then it could damage any transistor.

my advice , use a chip to interface the ttl +5volt radio signals, to the +-12 volts rs-232 standard

kind regards to everybody
federico
xe2nlm
pd i only have protect my inteface to the ts-850 by resistors and diodes, i know it is better the chip solution.

Hello dave
I might have a manual around here someplace. Let me know if you have found a copy yet or not and I'll have a dig ;)

In the mean time, I believe there was an article in QST from the spring of '97 about building an interface for Kenwoods. You can have also look at http://www.qsl.net/k0bx/ . He has two interfaces on the page.

Hope this helps

# 524. if 232c alternatives...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-03 20:05:07 UTC
From: D.Cy Gacuzana
Topic: 524  Message: 524

Hello all, I just joined, don't have the radio but Air1 informs me it'll be sent Monday. I guess I broke down and resisted all the kind eHam reviews of the 570G for brand new and went with a ten year old radio instead, at about the same cost, the 850S. I hope it works as stated, will cross fingers until I get over that bridge.

So my question is if anyone has experience with the LCU3 version, seems worth while, I have seen home brew circuits around but am afraid I'd botch some pin connection and ruin something. Seems the HB circuits included a resistor and zener diode, I wonder if the LCU3 has such protection, wonder if it matters all that much because if the LCU3 does everything the IF232C does, would be great to save some money and not have to worry about some other 12-14V power source.

I wonder what contest software 850 members here favor, and logging programs, as I have no experience with any of it, any info/advice would be much appreciated.

73, Darin.

# 528. Simple IF-232 alternative

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-04 15:22:55 UTC
From: Paul B. Peters, VE7AVV
Topic: 528  Message: 528

Just a reminder to all that I have posted the N6TR-style IF-232 Kenwood interface in the files / pictures section of this group. The interface requires minimal parts (2 items to be exact), will cost you less than $5.00 to build, takes almost no technical skills to construct and it works great! What more could you want? If you can plug in a soldering iron, you can build this interface -- it's really that easy.

OK Darin, welcome aboard. Main thing is, we are
active and we stay active!

Got my call in 1978 during first vanity call program,
which was for extras only at that time. K0ZL was my
first choice. I like the "ZL" on CW, seems to get
heard right the first time in contests, as long as I
can send it half way straight! har...

# 531. rs 232 interface

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-04 21:57:10 UTC
From: DAVE ...M0BZK
Topic: 531  Message: 531

thanks all for the advice re my interface. I now have a copy of the kenwood interface manaul. I have to get 2 new chips and try again but my fear is that some how I have damaged the o/p from the 850. If I put the scope on the o/p line all I seem to get is one burst of data then nothing. Does the computer have to poll the radio to get a o/p or should the radio send out data all the time.
Dave M0BZK

Going from rusty memory...

The rig sends out the information string "IFxxxxx...xxxxxxx ;" when "AI"
auto information, is turned on. Take a look at the list in your command
manual if you want detail. If you change the frequency on the front panel
and it spits out the string sometime shortly after (within the second), then
this is probably turned on.
"IF" only sends, when there's something that's changed. Otherwise, you have
to ask the rig to report info.

# 542. Memory channel control

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-12 20:37:33 UTC
From: maritimus49
Topic: 542  Message: 542

Hello all -
I have a problem with the memory channel control on the 850. It
is "skipping" frequencies a lot when I use it to tune steps. I saw
this happen on a Drake SW-2 and it was the encoder which I assume the
850 uses for this control. Does anyone know if Pacific Parts sells
this part or where I could look for some assistance?
Thanks.

73,
Bruce K6RQR

Bruce these are available. I will get you the encoder part number when I get to the shop tonight. I may have one also, if the minimum tries to bite you.
All radio owners should keep a spare encoder laying about, it's one of those things that you WILL wear out eventually and it makes life miserable when it's bad. Kinda like a defroster in winter. You can still drive, but... better keep the ice scraper handy! and DON'T get in the car with a cup of coffee!

First thing is to make sure the rig and the power supply are at least several inches apart.
Second, check the R8 and T8 voltages to make sure they are switching cleanly.

Does anyone have recent experience with INRAD Service?
I remember seeing a bad rap by one ham about six months
ago on <www.qth.com> and wonder if anyone else has had
a problem.

I need to send my 450S in for repair. When tuning up
you get the power level right but it will not hold the
setting some time later and power drops off.

I have the INRAD filters in it and really like their
well defined sharp bandpass.

I really enjoy SWL on the TS-450S. It is better than
my ICOM IC-756 for AM.

73,
Mel - KF6OZ

# 550. 850 & transverter fun!!

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-21 12:13:24 UTC
From: Max Donoghue
Topic: 550  Message: 550

For those interested I have successfully mated my TS850 with a Yaesu FTV700 6/2/440 transverter. It only has the 2m module right now, but I'm looking for a 6m add-on. You can set the display on the 850 to read exact 2m frequencies (menu # 27) which is a realy nice feature. Not much 2m SSB activity around here, but so far reports are FM are great, and the packet ability is nice. I modded the 850 to use the output from the RF driver circuit to drive the transverter to 10W output. This method prevents HF RF power from being transmitted into the transverter by mistake. So far the results are encouraging. I will post some pictures as soon as I can get the upstairs computer functioning again. It has the digital camera reader on it! DOn't suppose we have any computer experts on here do we??

Hey one bad rap in 6 mos for a co. of that size? That ain't too bad!
give 'em a call.
On your 756, is there a option xtal filter for AM? if so, get it, you won't be
disappointed.

From: Steve
Topic: 552  Message: 552

Hello. I own a TS-850S/AT. I bought it used (mint condx.) several years ago for $1000. I bought it from a dealer and have been completely satisfied with it's performance. I haven't got to do anything with it lately as I live in an apartment, but I am keeping it and I know it will get a chance to play on the air again, hopefully sooner than later. It's last use was Field Day 2002 and it is in good health.

These days I am on the air with an FT-100 in the mobile, all bands 80-up and most modes.

Hi Steve,

Welcome to the group. I also run a TS850S at my location which I purchased this year from another member on here Jeff, KC1MK. I stepped up to the 850 from the 450 although I hated to part with it. I just recently picked up a 2m transverter which I use with the 850 and it is like having a $1000 2m all mode. It even shows the 2m frequency. As I type this I am listening to the local police on 142.815 MHz! It has also allowed me to get back into the local 2m packet circles. Although with IRLP and EchoLink I am surprised packet has lasted as long as it has. I am also in an apartment but I strung an invisible antenna out in the yard which allows me to work 20m PSK all over the USA. Not much but at least it keeps me active. And with the transverter I can chat to the locals on the repeater. I just wanted to welcome you to the group, feel free to ask any questions you may have. There is a great bunch of fellas in the group.

73 for now,

Max

I have had good luck with Burghardt's service dept in South Dakota on my 850sat -- very short delay to assess problem and get it back -- none of this "we'll look at it in about 2 months and get back to you" stuff of the "high priced spread". And, you get to talk to *people*!! Give them a call and see...

Steve,
This is the same combination of rigs I am using. I purchased the FT-100, intending to use it in the house, but was not satisfied with the small size and the menus, or the transmit audio. So I bought a near-mint 850SAT for about $800 from a dealer, and am very happy with the pair. Although I am often tempted to plop the 850 in the car seat and use it mobile sometimes, because my time with it is very limited!
73,
Paul K4PDM

Hello Bill,

I just repaired the rig.
On the original layout the 2SA1204 is mentioned, but later on Kenwood
used the 2SA1213.
The main difference between the 1204-1213 is the bigger current.
See data at Toshiba who delivers them to Kenwood.
After soldering the new transistor the rig works fine again.
Tnx for your ideas.

73s Peter pa3fne

You can also call B&B Technical Services in Denver at 303-424-4858, or email 'em at bbtech1@.... They are real good with the TS-850. I know the tech real well, he's a swell guy! :)

I'm new to this group, and thinking things sure have been quiet...my 850 has been sitting in it's triple-box for over 2 weeks now, still haven't hooked it up; I'm hoping things are so quiet around here because the 850 is such a well made rig it seldomly develops problems. ha.
I bought the 850 as a backup rig for my Corsair I. hi hi. But really, it's turning into that, seems like I won't get it on the air until the Corsair dies or gets sick.
Really, I got it for dabbling in contests, computer interfacable was what I was after, and since a new 570G was in the same price class as a used 850, I opted for the phenomenal RX performance specs plus real nice looking CW keying waveforms used, as found in an 850!
It's just that, the ancient Corsair is working so well for the casual operating I have barely had time for lately.
Well, if all is well on the 850 front, that sure is one little thing to be Thankful for, and I just thought I'd say something here!
73, wellness to all,
w3dcg.

Thanks for the welcome. Just thought I would stick my nose in and see
what's going on. Maybe learn a little, maybe help a little.

I know what you mean about "no time." All my operating is on my mobile
FT-100 and, although I like the little radio, I LOVE my 850.
I wish I had time to wear it out!

First off, a welcome to new member K2UA.

In November alone we had 15 new members join the group. Once again I'd like to ask all members, if you don't mind, why not submit a photo of you and your station. I realize some may object to this and that's ok by me, but if you like the idea, it would be a great way for us to get to know a little more about each other. Any interested readings you have come across regarding the 850, 450 or 690 lately? And tips or mods you may have performed or read about to make these great rigs a little better? Any questions you may have dealing with a problem you may be having with your own gear? Put your questions and comments to the group, after all that is what we are here for. Personally I just finished building yet another CAT interface for my 850. I also incorporated a CW keying line into this one, although a week too late for the CW contest! The Canada Day Winter contest is coming up December 28 and I plan on operating CW only this time around. So get those photos in, and feel free to call on any member for help anytime, and to the members south of the border Happy Thanksgiving.

73,
Max

Hi Paul,

I spend more time building interfaces for my 850 than I do
operating! I recently picked up a 2m transverter and now use it
quite a bit on the local 2m repeater. Nothing but unsolicited
comments on the nice sounding audio. These rigs are definitely
keepers.

# 567. New poll for TS-850_450_690

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-11-27 04:35:03 UTC
From: TS-850_450_690@yahoogroups.com
Topic: 424  Message: 567

Enter your vote today! A new poll has been created for the
TS-850_450_690 group:

I'd just like to find out what
particular model of Kenwood the members
are using. Guess I just have too much
time on my hands.

o TS850
o TS450
o TS690
o TS950
o TS870
o TS940
o TS440
o TS430
o TS2000
o TS570
o TS530
o TS830
o TS930
o TS140
o None of the above

To vote, please visit the following web page:

http://groups.yahoo.com/group/TS-850_450_690/surveys?id=10980567

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

I use both the 850 (now my main rig) and the TS-440, so I just voted twice - one for each.

It appears you can vote as many times as you want, once for each piece of gear in the list that you use.

73, Zack W9SZ

Thanks Cy!
Well.. get that 850 out and start tinkering! At the very least, hook up to a long wire and enjoy the finest AM Shortwave/ AM Ham receiver ever produced.
I am continually impressed with the performance of the 850 on AM mode, especially with the filter selection ability... 4 different settings to choose from!

"D.Cy Gacuzana" <gacuzana@...> wrote:
I'm new to this group, and thinking things sure have been quiet...my 850 has been sitting in it's triple-box for over 2 weeks now, still haven't hooked it up; I'm hoping things are so quiet around here because the 850 is such a well made rig it seldomly develops problems. ha.
I bought the 850 as a backup rig for my Corsair I. hi hi. But really, it's turning into that, seems like I won't get it on the air until the Corsair dies or gets sick.
Really, I got it for dabbling in contests, computer interfacable was what I was after, and since a new 570G was in the same price class as a used 850, I opted for the phenomenal RX performance specs plus real nice looking CW keying waveforms used, as found in an 850!
It's just that, the ancient Corsair is working so well for the casual operating I have barely had time for lately.
Well, if all is well on the 850 front, that sure is one little thing to be Thankful for, and I just thought I'd say something here!
73, wellness to all,
w3dcg.

I have to agree with that! Sometimes I enjoy sitting in the evening and doing some SWL'ing instead of working anyone. The TS-850 is an outstanding performer for AM reception. I did the modification to take out the attenuation on the broadcast band (500-1600 kHz) so it would perform as well in that part of the spectrum.

I have found that in crowded band conditions, with the 6Khz filters, that even being 100-200 hz off freq on a weak AM sig make difference between readable and not readable. That's how selective the crystal filters are. I noticed the same thing on the TS-430 after I put the YK88A filter in.

Thanks Max, ought to be interesting.
Well here's what I am running here. TS-850 with memory keyer/voice mem, Drake R4B/T4X, Swan 500C/SS16 (16 pole filter), Halli SX-117. Computer is white box Athlon 900, cd/rw, two 40 meg drives, WinXP, no interface to ham gear yet. Wife works from home on computer (one of the schemes that actually works...www.alpineaccess.com will tell the story, if anyone is in the Denver area and needs work!)
Antennas are all wires and verticals: Delta loops on 20 and 10M, 40/80 trap vee, full 1/4 wave vert on 30M, 10M halfwave Ringo at ten feet.
Unimpressive stuff but serves us well and we have a lot of fun with it.
The field day rig is a 1976 Ford Mitchell camper on a E350 chassis, about 25 feet long, big block 460 (makes getting to field day a LOT of fun!), has fridge, heat, and head. Paid about 4500 for it, and dumped another 800 in for exhaust and tires... have had fun in it.
For batts we have the engine batt, the orig camper battery setup and additional 210 AH in the back just for the radios.
see pics in member files

Max,
I think that probably when the poll got re-set and you did not re-send us
the link, a lot of us did not bother to look it up! Sorry about that.
Maybe we could try again.
73,
Paul K4PDM

Max,
May I suggest a poll on not only the rig, but how it is equipped or
modified.
for examples IF filters, AF filters, mic mixer, receive preamp, DSP
unit etc.

OK:
TS-850, AM/BC band 20dB pad removed. Sidetone level mod. Resistor in PA unit strapped to make the fan run harder. K'wood 500hz filters. Rx ant line runs thru tuner when AT switch is on. That's about it, could not find any other mods that I really need.
Swan 500C/SS16 modified AGC circuit for improved attack and decay, but it's still audio-derived and subject to some distortion on strong sigs.
Heath SB-220, removed one tube and hard-wired power supply to low voltage on the B+, to reduce stress on power supply and plate dissipation on the tube, to allow 100 percent duty on rtty/fm/am modes (am drive to about 150 watts out of the amp, gives about 500 PEP on sidebands and no splatter reports). Run RTTY up to ten-fifteen minutes per transmission with no problem. FM on ten meters, it's amazing to fully quiet someone's receiver 12,000 miles away.

I'm interested in the mod to run the RX line thru the tuner when AT switch
is on. Has anyone done this mod?

I'd like to see that, too. I remember one for the 450 but not the 850.
Perhaps it is similar?

Well Bill,

Looks like you started something. If you ever do manage to dig up the info on that mod I would be interested as well. I did the mod on my old TS440 and it worked fantastic. I tried going thru the service manual but after 10 minutes of following traces I got dizzy! I also did the BC band receive mod and am about to do the sidetone mod. I would be interested in some info on the cooling fan mod too. BTW, is that fan supposed to be on all the time when you are transmitting or only when the PA reaches a certain temp? Mine kicks in as soon as I transmit.

Do you know where the instructions are to run the RX line through the
ATU for the 450? Maybe also for a 940?

Thanks,
Roy

# 603. Tuner Problems

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-05 14:55:28 UTC
From: Jjm Henington
Topic: 603  Message: 603

First let me clarify that I love most aspects of Ham Radio. The one I dislike is the tech part. Never been interested in building or repairs. That said I have a TS 850S/AT and the tuner has just stop working. I've had the unit for 8 yrs and never had a problem with it(that's pretty incredible don't you think). I purchased from Memphis Amateur Electronic.
Anyone have a suggestion on something a non tech person could check or give a suggestion as to where to send for service, Antenna I was trying to tune was just 2:1 without tuner. Thur tuner I can here the motor but the meter shows full scale until it drops.
Sorry this is so long.
Jim

Funny, mine did the same thing for a while during CQWW SSB a couple weeks ago but returned to normal a while later. I figured something just overheated. I was giving the rig a workout!

I'll have to study the circuit to see what might have caused it.

Jim, first try a reset (A=B, power on) and see if that does it. If not, you can send the radio (radio only, no mic or book etc) to me for repair.
Please see my website for more information. I am running 4 weeks backlog right now, trying to reduce that.
Thanks and 73!

Thanks to Kevin from the list my tuner is working again.
Just in case someone else should have this problem I'm sharing what Kevin passed on to me.
Kevin suggested that my carrier was turned down to low upon inspection it was set at 4. Since we were there I rotated the knob serveral times and it started working. A little dirt I guess.
Thanks again to the list.

Glad to see you solved the problem Jim. I sometimes sit here scratching my head wondering why mine isn't tuning, only to find I have forgotten to switch the RF back in line from using my transverter. Of course if the tuner doesn't get any signal to tune it just sits there whirling away. I already envision myself with the screwdriver tearing off the covers to see what is wrong when I catch my mistake.

Deltona, FL
Friday Dec 13 1145EST

Old topic - New player with the problem!

I know Bill can answer this, but put it to the group so everyone can benefit from his counsel.

Using a dummy load:

1. CW mode - PWR control full ON, KEY DOWN - bring power output slowly with CAR control

at about 80-90w there is a BUMP in the ALC - PO down, ALC settles to zero and I can continue on up to 100w or so.

2. LSB mode voice or digital AFSK -PWR full On -

Nominal 60-80w output peak on P.O. meter

Every once in a while that BUMP in the ALC - then settles down again.

While I've experienced the overall erratic/sensitive nature of the 850 for more than a decade, this symptom described is new.

73,
bud N0IA

Monitor the -6.0 volt output of the DC-DC converter to eliminate that.
Make sure something in the coax jumpers or antenna system is not breaking down with power.
Your DC-DC converter is now in a socket, so it's real easy to put a new one in and try
that.

# 612. Regarding new poll

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-17 21:43:49 UTC
From: Max <ve3tmt@yahoo.ca>
Topic: 612  Message: 612

It seems to me that it would take about 20 different polls to answer all the question regarding equipment used by our members. SO I am inviting everyone to post a message describing their station, including rigs used, antennas, accessories, mode preferences, etc. If you have performed any mods to the equipment that might be beneficial to others include a description of those as well. Should make for some interesting reading. I guess I will start it off.

My main rig is the excellent TS850S/AT. After reading about the SSB audio craze I purchased an Apex 430 studio condensor mic and Behringer MX602A EQ/mixer. I must admit it is sounding better than any other HF equipment I've owned in the past, except perhaps for the Kenwood TS830S I owned many years ago. The TS850 is also used with a Yaesu FTV700 2m transverter. Other rigs owned include a TS440S, Yaesu FT101E (my first rig), FT77, Icom 738, Yaesu FT900, TS830S, TS50S, TS711A, and probaby many others I can't recall. I recently purchased the Yaesu FT817 QRP rig and am having a blast with it. I have the W4RT speech processor with the Heil HC4 element which works really nice together. I homebrewed a 13' vertical that covers 40,30,20,17 & 10 meters that works really well. Much cheaper than the commercial antennas on the market. It is a tapped coil version of the MP-1 by SuperAntennas.

Mods on the 850 include the sidetone mod, enhanced noise blanker mod, antenna tuner on receive, separate low level output for transverter, and the broadcast band sensitivity mod. This radio is definately a keeper and will always have a spot on the shack shelf.

73,
Max

Hi Folks

well I am a ts850s guy that's for sure but at the mo its sick and I am too lazy to sort but I will one of these days.

My 850 has the broadcast band sensitivity mod which I did myself about 5-6 years ago. I have the 500hz 2nd and 3rd if filters in as well as a 270hz in the 2nd if
I moved house and at this moment in time I have only got a 40m dipole and hf2 vertical up. When the warm weather comes I plan on getting the mast up with a homebrew antenna that will give me 3ele on 20 17 15 12 and 5 on 10m.

At present I have a FT1000MP MKV which I use now and again on PSK31 and the odd cw qso. I miss my 850 bad and love to use it on ssb and psk31.

I am a member of the Stirling Radio club GM6NX and can be heard most Thursday evenings using a ts850s from the club shack on ssb or cw

I also do some contests as well. I was active in iota this year as GM5A and CQWWSSB as GM5A and yes I had a ts850 on 10m and 80m
I am also a PODXS member and do a few psk31 contest

I am in the middle of working out what way to do my shack so with some luck over the next few months that will be sorted and will be back on the air with my ts850 (well I can hope)

So that's a little about me
Stu MM0BSM

OK, time to make you guys feel active...

I bought my TS-850 in Florida, two months after it came out, absolutely loved it, built a 2M transverter, wrote software in DOS, VB1, 2,3, etc for it, did the BCband mod after about a year, have additional filters, speech syth, tweaked the power up a bit, (checked all modes with a spectrum analyser) and then proceeded to do a number of things that cut into the hobby.

First was becoming an Inspector, with the Canadian Dept. of Communications. (It's like an FCC Engineer.) Want to ruin your hobby? Do radio all day, for a living.... Don't get me wrong, I loved it! But at the end of the day, I didn't want more!!!

Next was having a daughter in 1995. Spare time? what's that???

Finally left DoC to work at Canada's largest Cellular service provider, and on the way there, got hired by the Test and Measurement group at Hewlett-Packard. HP spun that off into Agilent, they made internal restructuring that made no sense, so I took an offer at Tektronix and have been smiling ever since. Great company.

Oh, and I moved four years ago, and haven't put up an HF antenna since.

So I need you guys to keep the spirit alive. I really want to get an antenna up, maybe a vertical for now, and get that lovely TS-850S/AT back on the air where it belongs!

I still get to play radio, but mostly with my customers. Tektronix sells Rohde and Schwarz RF equipment, so I get to sell the best spectrum analysers ever made. Yes, even better than HP, er Agilent's!!! (Is 160 dB dynamic range good?) My wife still works at HP (Poor thing) so don't tell her I said this....

Watching the group, keeps me thinking about getting the 850 on again. Gotta keep the dream alive!

Thanks guys(gals too)

Jim VE3MIJ

Another "loop lover"... yikes!
I use resonant loops on 20 and 10, will be putting one up for fifteen by new years.
b

Hey Jim, you get all the cool toys to play with! That's not fair!
Try a quicky quad wire... 72 feet of copper, diamond shape... hang apex as high as you can. Feed at bottom with insulator or 1:1 balun, then 10.5' of RG-11 75 ohm coax, then barrel connector and RG8 into the shack. 13.8-14.6Mhz coverage, 4KW if you don't use balun, 1.5Kw if you do, and feed point can be 5' off the ground and it will give you fantastic results coast to coast. DX not as good as vert unless you get feed point up at least 16'... I use mine to blanket the States, with 400W absolutely no trouble unless band is really really dead. Great for net control.
Stateside, when operating QRP, I consistently get S9 and above reports.
You can scale the ant for other bands.. 10m is 31 feet and 5.5 feet of 75ohm feed...
Hmm verticals.. Every Gap Titan I hear on the air is kicking buttsky, at least out past 1,000 miles... the Challenger is a good one too. I love Cushcraft's r-series; had an R3 with the motorized cap at the base, kinda wish I had another. It was for 10-15 and 20 but tuned everything in between just fine.
The R5000 and R7000 are great, would not mind getting one if I wasn't saving for a tower and rotor and quad...

Hey never too late to learn! Using yer own wire (or power supply or whatever) is quite gratifying. Heck if you can buy a vertical and follow directions to put it together, you can do wire antennas. The nice thing is the cost, although my little ole quad only covers one band (thinking about a multibander though...), it costs about 12 bux to make, not including the feedline into the shack... but for that I use one of my retired 2M antenna feedlines, or one of the field day hunks I have layin around so that parts free... Anyway if you change your mind, I am sure there are lots of folk here just chompin at the bit to tell you about their favorite junque-box antennae...73!

# 620. DRU-2 module question

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-19 00:29:41 UTC
From: wolobmp <wolobmp@yahoo.com>
Topic: 620  Message: 620

hello all, i have a simple question that has to deal with the DRU-2 recorder module. i presently own a ts850,ts690,ts790 and ts711 but what am interesting in finding out is if anyone who has this unit installed in there ts850, is it capable of "recording what the radio is hearing", and then allow playback as well as re-transmitting it? there is quite an interest in this function to allow the other user to hear what there station sounds like on the air, which many stations who are running hf-fi-ssb, have an interest in this. a call was placed to kenwood today, but they were uncertain if the dru-2 module would record right off the air or not. anyone who has this module and a ts850, please try it and let me know if this does indeed work. my guess would be the rec-1,rec2,rec3,etc would function as a cascading-effect recorder, but could be wrong here. any help or your expereinces would be teriffic!
thanks! mike

Hey Bill, Thanks for the suggestions!

I'll have to take a look and see if I can do a quad... For a start, I was going to make a trap dipole, just to get on, but I'm going to think about this one through the holidays.

As far as cool toys, are you kidding?? That's why I love this job!!! I'm a real tekkie, so I embarrass myself with how excited I get over a new product... Like an oscilloscope with 70 GHz bandwidth... Just when I get used to what we can do, something else comes out that blows my mind. I'm never bored! And yet, I love my 850...

I really appreciate the tips on the verticals as well.. I've been out of touch on this. The last time I was up-to-date, the R5 was current with Cushcraft and they were just coming out with the R7.

If anyone is ever curious as to what different types of digital modulation look like, and how you change them, as well see what they would look like spectrum wise, you can download, for free, software called WinIQsim from www.rsd.de

I'll warn you, it's not for the faint of heart, but if you can understand it, you've done a great job at understanding the various types of digital modulation being used today. Just so it's clear, I'm not pushing any products. It's just a really cool piece of software for anyone trying to learn more in this area. And there's lots of hams that like this stuff.

Anyway, I want to keep this on topic, for the group, so I'll shut up now...

Here's a question for the group.... Has anyone ever considered trying to build their own crystal filters? (Maybe I'm crazy, but I was looking at it at one time....)

73 Jim

Jim,

I believe the DRU2 will allow off air recording and playback. I do it a simpler way. If you have your radio hooked up to the computer for digital modes like PSK etc, then use an audio recording program to do it for you. I use Cool Edit 2000. I can record anything off the air and play it back to the operators which I do all the time to the local 2m guys who want to hear what their mics sound like. My recording time is only limited to hard drive space available.

Max

I have been using a full-wave loop on 40 meters for about 8 years now. I love it. It definitely outperforms a dipole but isn't as good as a beam; I can't fit a beam in my yard anyway, so the loop is quite satisfactory.

It's actually a 2-turn loop to bring the feedpoint impedance into an easily manageable range. The antenna appeared in ARRL Antenna Compendium Vol 2 as "Magnetic Radiators - Low Profile Paired Verticals for HF" by Russell E. Prack, K5RP.

The original QST review of the 850 said the unit records only by "acoustical coupling," which I take to mean out of the speaker and into the microphone. This means that the playback on the other end will be influenced by the 850's filters on receive and transmit, and the frequency response of both the mic and speaker, as well as the frequency response of the receiver and speaker on the other end.
After hearing hundreds of playbacks on the bands, no recording ever sounds like the original anyway, to my ears.

Homebrew filters have been around for years... looking at the old Handbooks, looks like it would not be too hard to do... most of the kit-built QRP rigs have filters made from 2-4 xtals, not sure how they order them or what specs they use.
I use trap dipole for 80 and 40, and single-band loops and verts for everything else.
b

Max and the group

Thanks for the welcome!

For the station info:

I run a TS-850SAT that's ~10 years old. We've contributed to Kenwood's profit margin by purchasing a TM-V7A, TH-G71, TR-2600A, TV-502 2M x'verter (used...converted for use with the 850) and a variety of accessories...all still "running". We use the TR-2600 with a Tiny Trak-II for APRS (you can see us at www.findu.com)

Antennas:
7-band trap (coax) dipole at 20'
Homebrew 2-meter j-pole (works as a pretty good dummy load on 440)

73 and Happy Holidays to all!

Hello to all, Clayton here WB5TOI.
I was curious if anyone here had played around with computer control
of ts450. i have the IF 232 interface and manual. But just can`t
get radio to rcognize any commands from terminal program.
I have set program to my com1 4800 baud 2 stop bits but if type in say
"FA;" to read frequency it does nothing.
The radio will work with some shareware progs I downloaded so know
the interface and radio are ok. any help would be greatly appreciated
Thanks Clayton

Clayton,

If I recall correctly I had the same problem with my 450 before I
sold it. The computer and radio signals were "banging" in to each
other. I was using TRX Manager at the time. Using the same interface
on my 850 however worked just fine. Anyone else having problems?

Seasons Greeting to everyone in the group.

Hello All -
I have recently had my TS-850S/AT checked out and modified by none other than our own moderator, Bill, and I just wanted to say what a great job he did at a quite reasonable price. Despite being busy with several other rigs he managed to get mine finished in order to ship it back to me in time to move to a new job next week. Thanks to his expert work my 850 is now even more versatile and ready to go for another 10 years. I want to encourage you to consider his technical abilities when you need similar work done to your 850. In my opinion these rigs are one of the best buys on the used market and its very good to know that we have such exellent technical support when necessary.
Thank you, Bill.

73,
Bru

Hi Max,
I just purchased a TS 450sat as a backup rig and it has a TCXO and extra ssb filter and voice bd. I use a Heil HM 10 mike with this rig.This is my first 450sat and I am amazed at the receive on the little rig.
I am 58 yrs. old, married to Kent "W4NKB" and been a ham operator for 30 yrs. I have A1OP--WAS--DXCC--WAZ Awards and I belong to YLRL, ARRL, ARES, INDEXA (life), HIDXA (life), YLSSB (10603), TEN-X (16650), AND 4 local clubs of which I am secretary of 1 and treasurer of 1 and newsletter editor of 1.
I use a Yaesu FT 1000D/FL 7000amp and Hygain TH7DXX antenna for the main station but the Kenwood TS 450sat with Ameritron AL 1200 amp is being used more and more for DX.
Anything I can do to make it better?

Topic: 487  Message: 657

OK here's an update,
I finally had the time to take the TS-450 apart again and I started removing components one at a time until I found the culprit. It was D2, the blocking diode. It seems to have stopped blocking. I removed it and measured the resistance across it and saw 380 Ohms in BOTH directions. I replaced the diode and now the current draw from the battery to the RAM is unreadable with my ammeter so it's less than 10 uA, but the RAM has been keeping it memory when the power is removed.

Happy again,
Roy

Hi Alex.
You would do well to switch, the 850 has better IF stages and I love the dual crystal filters. Have not much use for DSP filtering yet, just doesn't sound right to my old radio ears.
Sorry, my 850 is not for sale!

From: TS-850_450_690@yahoogroups.com
Topic: 424  Message: 660

Enter your vote today! A new poll has been created for the
TS-850_450_690 group:

Here's one just for fun. If you had to
replace your current Kenwood rig, what
would you replace it with?

o Same rig
o Different model Kenwood
o Brand Icom xxx
o Brand Yaesu xxx
o I'd never be able to operate HF again!

To vote, please visit the following web page:

http://groups.yahoo.com/group/TS-850_450_690/surveys?id=11005333

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

# 661. TS-850 antenna tuner noise?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-28 03:44:05 UTC
From: Paul B. Peters, VE7AVV
Topic: 661  Message: 661

One of my 850's appears to have developed a noisy antenna tuner. When switching from band to band with the tuner in the Auto position, there is a high-pitched squeak or squeal that I think is coming from the tuner -- could this be? The noise just began and so until I figure out what is going on, I've put the tuner in the Thru position. Band changes with the tuner out of the circuit are normal -- so it's definitely the tuner that's making the noise.

It sounds like the mechanism in the tuner is dry -- any ideas?

Well it happened to me and I looked long at it and decided to buy the ft1000mp mkv
as I was looking for a brand new radio that was the only option for me. If kenwood were to bring a new radio out that is better than the 850 then I will sell the mp and buy it as for the 870 it doesn't come up to scratch
If however it was a replacement second hand then yes I would buy a ts850 as I feel that no other rig is as good

I still have my ts850 and will one day get around to sorting it and use it as my main rig but I am lazy at the mo so maybe a new year resolution coming on

Any way all enjoy your radios and have a great dx new year

Alexander,
I would agree with Bill. Although the amateur world in general would probably go for the newer rig, the 850 has one of the three or four best receivers ever tested by the ARRL in QST. I have never operated a 570, but the 850 is much superior to every rig I've compared, including the IC-746, IC-706, FT-100, and many older radios. If you do operate SSB, transmit and receive audio is excellent in the 850, and you can open up the receive (and transmit!!) bandwidth to 6 kHz, if you are into that sort of thing.

The only advantage I see in these newer radios is the extra band coverage, but in the basic 570 you don't get that.
73,
Paul K4PDM

Maybe someone has pointed this out, but why were Ten-Tec, MFJ, SGC,
Elecraft, JRC, Ranger, and any other HF rig manufacturers omitted?

Paul,
I was going to include a "other" selection but we would have never known what that brand would have been. The poll response doesn't allow you to enter any comments. I then thought about listing every manufacturer I could think of. If you have an answer other than those offered, by all means let the group know via a posting. It wasn't my intention to leave any particular manufacturer out, just attempting to see what others would consider if they had to buy a new rig. I have learned from my previous polss not to edit the question or answers as it resets the votes to zero!

Please let us know what your choice would be.

# 669. TS 450 battery replacement

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-29 04:17:26 UTC
From: Larry Nixon <lfnca@yahoo.ca>
Topic: 669  Message: 669

Hey all

going to get working on the 450 back-up battery. I have two options with questions...

1 - run wires from the board to a holder which I can tuck in the space betside the ATU at the back of the radio. - This would make future battery replacements easier but is there a danger of RF running along the wires, getting into the board and messing things up?

or

2 - try to fit a battery holder onto the board. - has anyone gone this route and does a holder "fit' once the face is put back on?

Thanks in advance for any and all replies

Larry VE7LFN

Hello Larry,
Either option should work. I have not found the wires to be a
problem. My temporary set up ran wires all the way to the outside
rear of the rig to a velcro mounted AA battery holder. There are a
couple of decoupling capacitors between the battery and the RAM so
they probably cleaned up any ripple. For a coin battery holder, you
could check the clearance yourself by simply removing both covers
from the rig, the top 2 screws that hold the front to the chassis,
and loosen the bottom screws (you don't need to remove them). You
can then simply pull the front away from the chassis and pivot it
down to get at the digital board and inspect the battery area.

To remove the old battery, you'll have to get to the back of the
digital board. To do this all you need to do is to remove the TOP
wire plugs and ribbon cables (be careful with those), then remove the
phillips head screws to the board and you can get to the back. If
you'd rather work on the board away from the rig, you can remove the
board entirely by pulling out the rest of the connectors and ribbon
cables off and the board comes out neatly. Fortunately, all the
wires and cables are cut so that there is almost no chance of mixing
things up.

Good luck
Roy

Hello Group,

I've been a ham for quite a few years now. Have been too busy to get on the air much. I had a TS-440SAT that I sold a few years ago. I really enjoyed that rig. I'm interested in getting back ham active and back on HF. I am investigating rig options.

I'm considering TS-440SAT, TS-450SAT, or TS-570DG. I have been watching ebay and eham and there appears to be some good rigs available for reasonable prices.

I am looking forward to the discussion here to help me make my decision.

Maybe a quick question would be in order. I suppose I could investigate this but, why not use all of your expertise! What are the differences between the TS-440SAT and TS-450SAT? They look to be very close in operational capabilites.

Thanks for the welcome!

Hi Curt,

Having owned both radios I feel qualified to answer your question. The TS440S was a great radio in its day, and when they worked, they worked great. But problems started popping up with the VCO circuits that were a nightmare to fix. In my opinion the TS450S is an entirely different radio. I don't think a single thing was "borrowed" from the TS440S. The transmit audio on the 450's is really good, and they have a good receiver. I recently sold mine because I had also purchased an TS850S and didn't need both. If you can swing a purchase on a used TS850S, you would be even happier. To sum it up, if I were in the market for either a 440 or a 450, I would go with th 450 no questions asked.

Good question!
I would go with the FT-1000MP with ALL the filters it would hold. Had one in the other day, had 1400 bux worth of filters for just about every bandwidth. Sounded absolutely gorgeous. And, it was only the third FT-1000 I have ever had in my shop.. compare to over 225 ts-440s's!!!
BUT if my budget were limited (and whose isn't??), I would replace with same rig, then work 'er over like I did mine and put in all the mods again.

Topic: 661  Message: 677

Put a drop of good old 10W sewing machine oil on the gear bushings.
If you use your tuner a lot, the capacitor bushings can wear out. bud's had worn to the point that the plates were touching and one cap had to be replaced. I have pics of the tuner ass'y apart, if anyone gets lost.
b
"Paul B. Peters, VE7AVV" <ve7avv@...> wrote:One of my 850's appears to have developed a noisy antenna tuner. When
switching from band to band with the tuner in the Auto position, there is a high-pitched squeak or squeal that I think is coming from the tuner -- could this be? The noise just began and so until I figure out what is going on, I've put the tuner in the Thru position. Band changes with the tuner out of the circuit are normal -- so it's definitely the tuner that's making the noise.

It sounds like the mechanism in the tuner is dry -- any ideas?

Do you have a space consideration? If not, look at the TS-850. Much better receiver than any of these other guys.
The 450 will give you some of the advantages of the 850 and has a very nice front panel. The tuner is much faster than the one in the 440 and the 450 does not have as many problems as the 440 can have. The 570 has been getting "ho hum" reports, in terms of not really bringing anything new to the table except 6M in the D model, and a cushy rubber feel keypad (which I detest, some guys love 'em).
I have an 850 and would not trade it, even with cash, for any of the other models.

The TS-450, although the same size as the TS-440, is really not the same rig at all. Some of the features of the TS-850 have been incorporated into the TS-450.

I have had my TS-850 for about 6 months now and I'd recommend you get one if you can afford it. It's an outstanding rig and is still favored by contesters. They seem to be going for around $750 on average now. I paid $900 for mine but it's in absolutely mint condition and is loaded. I may get the ICE filters some day but the performance has been great for me so far, especially in contests.

I also have a TS-440 that is a standby rig now. I did the corrections for the glue that is put on the VCO board. It was a big pain but was worth it. I worked as an electronics tech for 10 years and this same glue was always a problem whenever it was used. One model of VCR in particular used it on a DC-DC converter board. When they discovered the problems it caused, they supplied a repair kit for it. But I took that VCO board out of my TS-440, removed EVERY component a few at a time, and cleaned all the glue off. I replaced a couple damaged parts and put it all back together. I haven't had any trouble with it since.

I didn't see any glue in the TS-850, so I think they got away from using it.

Larry, last summer I installed a battery holder in my 450 & best I can remember I mounted mine at a opening space up front near the ATU. I wrapped it with electrical tape to prevent any shorts. The holder I used came from Radio Shack & I used a PC mount holder which is smaller. I did not have any problems with RFI getting back into radio.

The original battery was still good, but had just begun to corrode. I read this somewhere on the web that this was a common problem with the original batteries used in the 450. I did this to keep this from happening again.

Hi Sean,

I am a proud owner of the same combination, a TS850+DSP100, the best combination ever! The DSP100 creates a third IF stage filtering,, so a combination of analog and digital filtering in IF stage=UFB!!. Most modern rigs filter only DSP in IF stage or only analog filtering + DSP in LF only.

regards,

Kees - PA7TWO

From: pa7two <pa7two@netscape.net>
Topic: 683  Message: 688

Hi all,

Let me introduce myself a little:

I am Kees PA7TWO/M5TWO, I live in The Netherlands, in a small town nearby Schiphol Airport Amsterdam named Hoofddorp and 35 years of age. Married to my lovely wife Antoinette and have two kids Keesje my son and Anna my daughter.
I am a licensed radio ham since 1991 as CEPT class II (30 MHz and up) have a DXCC USB on 50MHz and since I took the full CW exam back in Englast last year August during a short holyday, I have a full HF license, with no restrictions on power (400 watt max.) nor modes.

My Dutch license is "PA7TWO" (vanity callsign) and my British callsign is "M5TWO" (also restricted vanity callsign, M5 callsign is closed).

I am very active on 28/21 and 14 MHz bands and I enjoy the most the ten meter band.

My radio's are a KWD ts690sat+DSP100 unit for solely use of 50MHz and a ts850sat+DSP100 for HF usage. Antenna is on 50 MHz 2 x 5 elements homebrew and on HF (28/21 and 14MHz) a small Mini Quad beam , also home made, original design from Q1, an USA brand.

I hope to read many postings regarding these fb KWD transceivers and if you gents have any questions, please raise them.

Vy 73, de Kees - PA7TWO/M5TWO.

# 689. ATU on the TS690 and SWR issue.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2002-12-30 12:21:00 UTC
From: The SixManiac
Topic: 689  Message: 689

Dear all,

Okay my first question for this group:

Sometimes when I tune my ATU in my KWD ts690sat I see that the SWR is not always 1:1:1. Instead sometimes 4 digits of the SWR meter are displayed and when I re-tune on the same frequency (some time I need to do this a couple of times), the SWR is 1:1:1.
This phenomenon appears mostly on the 14MHz band.

A local dealer told me to tighten all screws in the PA board (actually I did that on all screws in the whole tranceiver) and indeed the SWR is slightly better and this phenomenon appears much less often.

I read in the service manual that the ATU stops tuning at the arte of 1:1:2 or better. I checked the settings for the SWR meter, all seems to be according to the specifications.

Who can help me? Are these higher SWR readings normal? Have other users actually the same behavior on their ts690sat? (in other words, do I worry to much?)

Vy 73, de Kees PA7TWO / M5TWO.

# 690. Filter wanted. (455kHz slot)

Welcome to the group Larry, that's a nice lineup of gear you have.
At one time or another I've owned 'em all. Traded my TS711 to get my
TS850. Luckily I found a 2m transverter to get back on 2m SSB!

Congrats on the radio! Keep eye on ebay for DSP100, but you will probably get a better deal if you can find and jump on a ham classified listing, as in eham.net or similar.
On the mics, you will do well with either one, I hear a lot of Goldlines on the air and they sound fantastic. If I had the money, that is the one mic I would buy.

Kees, I would not worry about this... If a tuner stops at 1.5:1 or better, it's fine, and because it is a linear system, it is not exactly repeatable.
Only other suggestion would be to make sure rig and PS are grounded. I would also remove the negative lead fuse, unless you are in a mobile with the rig plus and minus connected directly to the battery; that is the only time you ever need to fuse the negative lead for safety. Any other time, it's using up between 0.8 and 1.5 volts and potentially causing problems.

Wow Kees, two DSP-100's! I will be lucky to find one here for my 850!
Sounds like you have a nice family. I am 38 years old, with 2 kids,
a son 10 (still learning CW!) and a daughter 17 (need I say more!).
My wife and I have been married going on 13 years, although we have
been together 18 years. She has learned to tolerate my ham radio
hobby.

Best of the new year to all the members.

Max

We have so many new members, some confusion was inevitable!
Hey Max, thanks for helping to moderate this fine group! Waiting anxiously for everyone's HAPPY NEW YEAR message!
Here is mine:
Our pastor talked about "New Year's resolutions" and the futility thereof. Indeed, any New Year's resolution based on our will to do or not do something is doomed to failure, because we fail. It seems as though, as soon as I deem NOT to do something, there I am doing it! (See Romans, chapter 7). This leads to a great deal of frustration and guilt, which starts the whole cycle over again. So, what is one to do? Well here is an idea. Instead of making promises to do this, or not do that, why not just pray for spiritual growth and maturity? And let God take it from there. So much easier! I find that as I grow in my faith, that God provides the nourishment and actually helps me to change from the INSIDE OUT. This philosophy will work for you, no matter what religion you are. The fact is, if you rely on your own strength, you are bound for failure, but if you look outside yourself, you will have success.
Another approach, is to honestly evaluate what your purpose in life is. Is it to grab all you can? Do it your way? Watch out for number one? or is it to focus on others? To GIVE it all away, to satisfy others before yourself? Most religions teach selflessness. Why is it then, that it seems like the whole world just wants to push and shove it's way to the top? Because it's NATURAL to do that. Animals do that (just try feeding two dogs with one dish, and watch what happens!). But we are not animals. We are men and women, and we are different. When we focus on others, rather than ourselves, we are inherently happier. Isn't that the goal, to be happy in life? Then, GIVE IT AWAY, whether "IT" is your time, money, energy or other resource. In the end, you will GAIN much more than you GAVE.
May you all have a HAPPY and PROSPEROUS New Year, and may we all learn more how to GIVE IT AWAY. Vy 73!

Hi OM Max,

Yeah a good friend (PA1HR) of me traveled to Friedrikshaven in Germany early this year (biggest ham event in Europe) and got me an extra DSP-100 unit, from an Italian radio HAM. Here in PA they are very very rare and very expensive. New units are not available anymore.

How true Jim. Nice thing is the 850 has the inputs and outputs
already there! I asked Santa for a DSP-100 but I guess the elves just
didn't have time to make me one.

# 707. Re: [TS-850_450_690] ATU on the TS690 and SWR issue.

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Bill
Topic: 689  Message: 707

I cut these out and lap solder the two wires, using a piece of #22 or so wrapped around the lap joint to hold the wires for me, then heat-shrink.
Again, the only time you need a negative lead fuse is in the mobile, when running the power leads from the radio to the battery terminals. Not needed at home.

Enter your vote today! A new poll has been created for the
TS-850_450_690 group:

If Kenwood were to introduce a small
portable QRP radio to compete with the
Yaesu FT817, what features would you
like to see most?

o All mode operation
o All HF bands
o Plug-in band modules
o Internal batteries compartment
o External power capability
o Built in speech processor
o Large LCD Display
o Variable power output
o VHF/UHF bands included
o Kenwood Audio!
o Built-in tuner
o Built-in keyer
o I'm not a QRP fan

To vote, please visit the following web page:

http://groups.yahoo.com/group/TS-850_450_690/surveys?id=11009405

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

# 713. Re: TS 450 battery replacement

Yahoo group: TS-850_450_690 (2001 — 2005)

Thanks to all who answered my questions about the 450 battery replacement.

Ended up going the "remote mount" route. Picked up two smaller batteries with holders at RS. Did two 450's and ran wires back to the space by the ATU in one and over to the speaker area in the other. Wrapped holders in tape to prevent shorting. Happy to say that both have survived the operation, although I would definately recommend using a static strap and an ESD safe solder station.

Both radios were about ten years old. The battery was fine in one but had started to leak and corrode the board in the other (mine). Fortunately the corrosion was not too bad, guess I caught it in time!

I have also written the date and battery type on the bottom of the radios so myself or future owners will know when and what.

My thoughts on the "remote battery placement".

If the battery needed to be replaced every year or so and took 2 hours I could understand the holder. But with a typical life of over 10 years and 30 minutes to replace it it doesn't make sense. The contacts of the holder will oxidize and cause intermittent connections that a soldered connection will not. This is something I have seen. Makes the radio do strange things.

Maybe I wasn't looking close enough. I do have on hand a replacement computer motherboard battery and holder just in case. I had thought about replacing the original with it as per a mod I read somewhere. I will however wait until the existing battery starts to go flaky. Haven't had any problems yet.

I am a little tardy at sending this greeting message to all of you.i have finally gotten time to get in here and say a big HOWDY!!.hope you had a great christmas and have a happy new year.it appears my 850sat has a problem which has me baffled as to the possible culprit. i was operating on 40 mtrs,at full power(100watts),i noticed the alc level would go from no show to full scale at random.i checked the swr-it was ok,i listened in on the monitor function,my audio was brash sounding when the alc was at no show on scale and would momentarily disappear when the alc would max out on the scale.at the same time the rf power would show different levels of output.this problem appeared in ssb mode.i went to the am and fm mode and found a slightly different result-the alc and rf power output would slowly pulse or ramp up and down the meter scale.the transmitter now only puts out about 15 watts max.as i mentioned i was on 40 meters however,this problem occured on every band during my test.the antenna tuner works fine.in fact everything else works fine.can anyone tell me what to check.or if it should go back to kenwood??.i have a ts440sat as a back-up.but i sure am spoiled and miss my 850.thanks for your help in advance.Larry N4QDE 73!!

Hello Larry,
It looks like you have the infamous ALC voltage problem, you can
read more about it on:
http://n6tr.jzap.com/850repair.html

and a complete discription of how to fix it:
http://www.qsl.net/k0bx/ts850flu.htm

The fix is to either replace the DC/DC converter board (about $15), or
replace the surface mount parts (a couple of $ and more labor
intensive). Some people have even replaced the surface mount parts
with standard parts since there is apparently plenty of room around
the board to "dead bug" the parts onto the board.

I know that soldering in wires would add 2 more connections that would possibly fail, but how about soldering wires to a battery with solder tabs and placing it someplace where leakage would not melt PC board traces like Larry did in the cavity next to the ATU? Removing the battery takes no more time than to unsolder one and quickly solder on a replacement.

I was pondering a little overkill by putting in a "monster" Lithium battery like a 1300mAh DL123 into the TS450. But with a shelf life of ~10 (+/-) years, it would be senseless to put a battery with 70+ years worth of current drain capacity since it will self discharge way before the RAM runs it down. On top of that, it just means more stuff to clean up if it ever does decide to leak. Sometime we just out-think ourselves :0

Lots of discussion on battery replacement :)

Could have got a direct replacement for the battery that was in the radio but the gods only know how much Kenwood would want for a replacement, plus shipping etc.... At least the tiny local hardware store stocks the battery I have used.

Ten years life was good for the battery but I have heard of them leaking in much less time.

When I replace these boards I put in 1/2 of a 22 pin dip socket, then the new board. Makes it a cinch to change it later. Wish we didn't have to!

The following TS-850_450_690 poll is now closed. Here are the final results:

POLL QUESTION: If Kenwood were to introduce a small portable QRP radio to compete with the Yaesu FT817, what features would you like to see most?

CHOICES AND RESULTS
- All mode operation, 7 votes, 11.48%
- All HF bands, 7 votes, 11.48%
- Plug-in band modules, 0 votes, 0.00%
- Internal batteries compartment, 4 votes, 6.56%
- External power capability, 7 votes, 11.48%
- Built in speech processor, 4 votes, 6.56%
- Large LCD Display, 5 votes, 8.20%
- Variable power output, 6 votes, 9.84%
- VHF/UHF bands included, 5 votes, 8.20%
- Kenwood Audio!, 6 votes, 9.84%
- Built-in tuner, 5 votes, 8.20%
- Built-in keyer, 4 votes, 6.56%
- I'm not a QRP fan, 1 votes, 1.64%

Well, it looks like most of the respondents are looking for a Kenwood equivalent to Yaesu's FT897, with a few added features. Icom has the new IC-703, Yaesu has the '897, it might be Kenwoods turn to throw something new into the pot. I liked the features of the FT817, but I got rid of it because it was a little too small for my hands. I picked up a Patcomm PC-9000 in a trade, but have yet to give it a good tryout. Not enough hours in a day for ham radio I guess!

# 729. Re: [TS-850_450_690] New poll for TS-850_450_690

I would too. The only rig that would eclipse the 850 would be a FT-1000MP with all the filters...

Hey Bill,
That wasn't the point! I just was wanting all the bases covered.

I have started a new job and have not been able to check email all week,
thus the late post.

For the record, I'd choose another 850.
73,
Paul K4PDM

Hi Everyone,

Thanks for the welcome.

My name is Gerald Tilley and my callsigns are VO1YYT & VO1TIL. My QTH is St. John's, Newfoundland, Canada.

I am retired and 71 years old. I've been a licensed ham since 1954.

I am using the Kenwood TS-850S since it first came on the market and it is working FB ever since.

My interest these days is in digital modes especially PSK31, where I am a new comer.. I am using the RigBlaster Plus interface from my rig to my computer with MixW 2.06 (reg) software. I also use the CommCat program which controls my Kenwood.

I would like to hear from members who are using computers with the TS-850 and also those who are using PSK31.

73 's for now and best wishes for 2003!

Hi Gerald,

Welcome to the group. To answer your question I am also using a TS850S running PSK31 and other digital modes. I also use MixW 2.06 although I don't use any interface. The audio lines run direct to the ACCY jack on the 850. I built the PC control interface for it though. In fact I spend more time on PSK than any other modes. Look for me around 14.070 most evenings. Can you tell me more about the CommCat program? You can e-mail me direct at ve3tmt@...

73,
Max

hello all. wanted to pass along some info about an external speaker that i got for xmas. the url is www.soundssweet.com. if you are looking for an external speaker, that will produce some excellent audio for all modes, this IS the speaker to have a closer look at. the price is about the same as "name-brands" but this speaker offers much more sound reproduction then any other speaker i have in the shack. one "negative" item is the size! it is large compared to today's external speakers offered, but it is quite worth finding a spot for it in your shack. just wanted to pass along some info about it,and of course, do not work and/or have any assoications with the company that makes them. tnx for reading and happy listening! 73 de mike....wd8bmp

Thanks for the tip Mike, I am always on the lookout for excellent
sounding shack speakers. The mating speakers sold by Kenwood et all
are so darned expensive. I've been looking at either an SP940 or
SP950 but they sell for over $300 up here in Canada.

73,
Max

Gerald,
I use the 850 and PSK-31 with MixW almost exclusively. I get good clean audio spectrum reports when I run audio input to give about 50% MAX power. One of the biggest problems you see on PSK these days is folks overdriving their audio input and splattering. The 850, when driven correctly gives a very clean signal on the band.
CU on PSK!

While never have actually having repaired the X59-1100 board I am 90% certain the problem is the transistors. The TS50 has exactly the same circuit except it's not on a separate board it's on the main board. When I repair a TS50 I replace the transistors (3) and it fixes it. While there I replace the SM 47UF caps as they tend to leak. These caps serve the same function as the thru hole mounted caps external to the board on the TS850 and those I never replace. A process of elimination says the problem is the transistors. Why???? I don't know.

Bill,

Meant to write back about the strange tuning that my TS-690
developed. Turning the main knob one way would work correctly,
turning it the other would constantly reset to ca. 50.127MHz.

A soft reset cleared the problem.

Thanks

# 746. 850 noise blanker mod results

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-01-15 14:18:24 UTC
From: ve3tmt <ve3tmt@yahoo.ca>
Topic: 746  Message: 746

Finally got a chance to try out the noise blanker on my 850 after doing the mod (removal of 2 capacitors)last night. Came home from work, flipped on the radio and was greeted with an S9 noise unlike anything I have heard before. Almost like manmade static but not a motor sound. Anyway the NB1 on the 850 knocked it right down to an S2 level making PSK copy perfect. NB2 also was effective on removing the noise, making me wonder just where it was originating from??

# 747. Re: [TS-850_450_690] 850 noise blanker mod results

> b

Yeah if you turn the NB level up too high it cuts the receive out in regular intervals. I never use the NB2, but I thought it was funny both were effective in removing the noise. Makes me wonder what is causing it??

Hi Guys
Ok I was in the guts of my 850 last night to try and find the cause of the lack of power output and I think I found the culprit that caused the smell in the first place
its C1 on the car board (X50-3140-00)

WHAT CAUSED THIS I DON'T KNOW but I am open to suggestions I thought about checking the 2 ics that are in line voltage regulators I think they are AN78NOS

Does the anyone know if the car board can be bought and if so how much?

also here is what happened to alert me of the problem

I was running in the CQWWSSB test 2001 as GM2T on 10m and the radio started to drop power their was a strange smell so I stopped check everything
ANTENNA KT34XA was ok
ALPHA 91B sees ok
VOICE KEYER seems ok
POWER SUPPLY ok
TS850S weird smell and power lost

So after a cpu reset and a test its all ok so reconnect all up again minus Voice keyer and 5mins later same again Try to TX power looks like its going up then falls to ZERO instantly So leave for 5mins connect only radio to dummy load all is ok after 10 mins of keying into load was fine so reconnect
and try again into amp antenna and same again

This has me puzzled so to save damage I disconnect 850 and come home

So know I have eventually got into the guts and I hope I can repair it with the help of you guys So I await your responses

Welcome back to the group, Mike we missed you.

I would also like to thank our newest members, piratelooksat400;
herthahansasen; jc72346, n2lno Freddy and llamaack.

Been kinda busy this week, so didn't get to welcome each one. But
that saves the old inbox some grief, doesn't it? hi hi..

y'all enjoy the group and the fine line of Kenwood radios.

73!

Bill

# 751. Re: [TS-850_450_690] TS850

The same C1 failed in my 850 but I couldn't find it
because there was no visible evidence. I smelled it
all right! The capacitor straddles the key line so
when it blew out the key line trace was burned causing
Q152 on subunit TRX (X59-3680-01) on the IF Unit to
fry. You can't replace the transistor very easily
because the subunit has to come off the IF board (use
solder sucker and wick), so get stock number
KX59-3680-01 from Pacific Coast Parts (800) 421-5080
for $11.50 (Get 2 in case you screw up). Clean and
repair the trace under that C1. Replace a new C1. The
subunit generates the keying voltage for transmit. If
the key line is shorted as in my case, the subunit
will be history, and you won't be able to transmit.

Hi Charles thanks for that info will check that out as well
do you know if the car unit{X50-3140-00} can be bought as a whole board?

Creative application of the X-acto knife to remove "ALL" the burned board, possibly a jumper wire in extreme circumstances and it should be fine. A new 47uf cap (non-surface mount) and then you can repair the damaged TRX unit. If you need more info e-mail me.

The line that is shorted on the Car unit is the TXB (transmit bias) line (+8v in TX). The short usually causes the transistor on the TRX unit to fry the board. The radio still seems to go into TX because the PTT switch triggers the UPC and the TRX board at the same time. The UPC thinks it's in TX, the TRX board cuts off the RXB (receive bias +8v) line but because of the open transistor the TX bias is missing therefore the radio is in limbo.

Food for thought: I have found numerous leaky surface mount caps in radios over the years. They have all been 47uf @ 16v. This observation covers Kenwood and Icom and several different models BUT the cap is the same value in each case. Hummmmmm?????

C1 is a 47 uF 16v smd electrolytic cap, prone to blow when things get spiky... this is connected to the 8v line coming in to the CAR unit, so I doubt it was the regulators which are downstream. I would replace C1 and chalk it up to 'random electrical failure'.
I don't think you want to replace the whole unit.
b
Stu <samalex@...> wrote:Hi Guys
Ok I was in the guts of my 850 last night to try and find the cause of the lack of power output and I think I found the culprit that caused the smell in the first place
its C1 on the car board (X50-3140-00)

WHAT CAUSED THIS I DON'T KNOW but I am open to suggestions I thought about checking the 2 ics that are in line voltage regulators I think they are AN78NOS

Does the anyone know if the car board can be bought and if so how much?

also here is what happened to alert me of the problem

I was running in the CQWWSSB test 2001 as GM2T on 10m and the radio started to drop power their was a strange smell so I stopped check everything
ANTENNA KT34XA was ok
ALPHA 91B sees ok
VOICE KEYER seems ok
POWER SUPPLY ok
TS850S weird smell and power lost

So after a cpu reset and a test its all ok so reconnect all up again minus Voice keyer and 5mins later same again Try to TX power looks like its going up then falls to ZERO instantly So leave for 5mins connect only radio to dummy load all is ok after 10 mins of keying into load was fine so reconnect
and try again into amp antenna and same again

This has me puzzled so to save damage I disconnect 850 and come home

So know I have eventually got into the guts and I hope I can repair it with the help of you guys So I await your responses

Stu <samalex@...> wrote:Hi Guys
Ok I was in the guts of my 850 last night to try and find the cause of the lack of power output and I think I found the culprit that caused the smell in the first place
its C1 on the car board (X50-3140-00)

WHAT CAUSED THIS I DON'T KNOW but I am open to suggestions I thought about checking the 2 ics that are in line voltage regulators I think they are AN78NOS

Does the anyone know if the car board can be bought and if so how much?

also here is what happened to alert me of the problem

I was running in the CQWWSSB test 2001 as GM2T on 10m and the radio started to drop power their was a strange smell so I stopped check everything
ANTENNA KT34XA was ok
ALPHA 91B sees ok
VOICE KEYER seems ok
POWER SUPPLY ok
TS850S weird smell and power lost

So after a cpu reset and a test its all ok so reconnect all up again minus Voice keyer and 5mins later same again Try to TX power looks like its going up then falls to ZERO instantly So leave for 5mins connect only radio to dummy load all is ok after 10 mins of keying into load was fine so reconnect
and try again into amp antenna and same again

This has me puzzled so to save damage I disconnect 850 and come home

So know I have eventually got into the guts and I hope I can repair it with the help of you guys So I await your responses

Well I just checked and the q152 is blown on the trx board so going to take
the board out
thanks for that tip Charles

will let you know when I get it out

I feel good now I am seeing the light and maybe soon to have my ts850
working again

Hi group.
This is my second message because the first one for unknown reason do not e-posting.I need you opinion and maybe you help at this problem.My ts850 under 10.499.00 mhz and above 21.000.00 mhz it's working perfect.But in this zone 10.5 to 21 mhz with a peak to 16 mhz the tx audio (both usb-lsb) it's overemphasized like something to overdrive the audio makes the sound to be distorted.The problem exist over to 20-30 watts output.If i use speech prossesor i have not ALC indication on meter and tx audio it's horribile bulky. I make all tests with dummy load and antenna. Also i use for power supply battery and external switching power supply without any lucky.
Any help welcomed.

Hi all.

I'm considering buying a ts-850 to replace a now deceased entry level rig.

It appears that the 850 would be a good step up, and the price is inside my budget. I'd prefer to buy something new, but I'm more interested in a receiver with good selectivity, mostly SSB.

Before I take a chance on a used rig, I was hoping to get a bit of feed back on a couple of issues.

Are parts for this rig still available when repairs are needed?

Is this rig prone to any particular problems I should look for in a used rig?

How is this rig for SSB contest work without the optional filters?

Thanks in advance for any opinions.

Mine has been trouble free except for the three times I have blown it up. Twice with lightning or wind-static, and once with a Henry 2K that went looking for neutral through the ground in my 850!!! hi
If you get a nearby lightning hit, it will take out the tube and a diode on the RF unit. you can get parts for them.
The gas arrestor tube likes to fail often, due to high voltage spikes on the antenna from static, etc, just pop a 1mH choke across the antenna just like in the old days, it will make the tube last longer. They are easy to get and easy to change, about 7 bux.
the stock SSB filters are fine for contest usage... with the slope tuning you will be in hog heaven.

I've only had mine for about 6 months and have had NO problems with it yet, so I don't have any experience with trying to get parts for it.
I did do the mod to remove the attenuation from the AM broadcast band and found that relatively easy (for me).

But as I am an avid contester, I can say he is right about the rig's performance in contests, both CW and SSB. It's quite wonderful and is still one of the prized rigs among contesters.

The Amrad filters are supposed to make it even better, but I don't have those yet and I'm pleased with the stock filters so far.

Thanks Zack!

I also have the K'wood 500hz CW filters, and would recommend if anyone buys the CW filter for this rig, get both. The 455Khz filter is more expensive but that's because it's a 16 pole filter and has larger crystals than the 8.8. The two of them together are awesome.

I have heard the 400hz Inrad filters in another rig. They are marginally better and I think they are about the same as the Kenwood in price. If I didn't have the 500's, I would probably go with the Inrad units.

I bought mine when it had been out for only a month or two. It's been flawless all that time. I still love the rig! I'm trying to remember when that was... '90? '91? Not too bad. I've long since thrown out the PC I bought around that time. I think it was a 386! With Windows 3.1... RF equipment beats everything else, every time....

Hallo again.

First of all many thanks for responce.Second return to my problem.Exactly the same thing when i conect to a dummy.The modulation in 10.499.99 mhz it's perfect, but with the BPF relay makes a click to 10.5 the ALC meter going down to zero from any point i have before calibrate and starting this tx modulation distortion.The outpout power stay same about to 70- 80 watts and if i turn down to 25 watts the ALC showing to work again.But any way the modulation has overload level.Hope to help with this description for any conclution about this condition.

1. Do you have a service manual???

My first thought would be a shorted/leaky diode in the RX filter. To
check for this locate IC-1 on the RF unit. Put the radio on 20m and
check the voltages on IC-1.
Pins 1-3 ~11.5v
Pin 4 <.5v
Pins 5-7 ~11.5v
Pins 9-11 ~11.5v

Especially check pin 3 for abt 4-6v, if so then it's probably D16.

Hi Clif

Yes i have the Service Manual and i make all test from item 23 to
30. Everything seems perfect.Also the voltage it's same to you
describe below.In 20m.
Pins 1-3 10.5 +/- .05
Pin 4 .40
Pins 5-7 10.5 +/- .05
Pin 8 Ground
Pins 9-11 10.5 +/- .05
Pins 12-13 .08
Pins 14-16 4.8

Any other idea?
73

One more check. On the RF unit make sure the collector of Q6 and Q7 are both high when on 20m. Or look at the Anode of D8 and D11. Should be ~11.5v.

I'm trying to find a connection between the exact range of distortion and something being switched in or out at those points. So far nothing seems to match up but your description of the problems points me first to the RX BPF filters. That's why I 'm having you check those.

Ive been ham for 35 years - tried many radios. The 850 now is the best radio for the dollar on the used market. The receiver in the 850 is almost as good as the receiver in the TS 870. The 850 receiver sounds much better than my Icom 746 also. To find a better radio, you will buying a high priced newer radio exceeding $1,500.00 no question.

Them, with coorsbill our moderator as an 850 repair expert - your in good hands should you have problems and need service. Bill has done all the mods to my 850 and its an even better radio than before.

I have available the Kenwood PS-52 matching power supply for the TS850. I'm looking for a good 2 meter FM xcvr on trade or will accept offers on the power supply.

Hi again to all readers

Dear Cliff I check all that components in BPF filters.Everything seems ok.Like say on Page 110 on Service manual i check all pins of IC1 and the Q6 Q7 each BPF is active low. When the 20 it's low all other has ~10.5 about. Something else, when i remove the CN2 coaxial from RF board (DRV output) then on my monitor i have no change in tx mod from 10.499 to 10.5 of course i have not displaying the ALC level but the quality of modulation seems ok.Not distort in any band.After that i check also the relay on LPF and that it's ok.The problem exist just i say before,when i turn from 10.499 (on relay click)to 10.5 with a peak in 16mhz after that comes down and disappear on 21mhz. On 19.999 i have it on 21.000 crystal clear tx mod.This problem make me blood boil.Hi Hi.Any way any other idea welcoming.

I hope to you be wrong for DDS dear Bill :), for only one
reason.
I check on www.pacparts.com to buy a new one and My good God the
price is a half ts-850 ($324.87)?????
Any suggestion for any other supplier? Or where i found that in fair
price?

Ok to be sure we are looking in the right place disconnect the RX
ant line where it goes into the RF unit and see if the distortion is
still there.

If so then check Q49 and make sure it's working (the collector
should go to ground in tx).

Also check again on the DDS chips, P/N YM6631, they are $28, you
must have priced the entire board.

No, that is the correct price! However, you should be able to find one of the DDS ICs that is faulty, using freeze mist and a hair dryer.
The chips are about 25.00 each but tricky to change.

I check on www.pacparts.com to buy a new one and My good Good the
price is a half ts-850 ($324.87)?????
Any suggestion for any other supplier? Or where i found that in fair
price?

Thank you Bill.
I am waiting for the resaults. In the meanwhile I will buy a couple of that chip for any unexpected reason.

Also i make all test Dear Clif. If I unplug the RX line from RF board the problem exist.I chek Q49 and work under all situations.Something more for that problem. Freq:10.499 Mod:CW TXPower:80 watts the ALC shows full scale. Now Freq:10.500 Mod:CW TXPower:80 watts the ALC shows zero. Well exist also in CW mode. Other test. Freq:~16.000 (this frq it's the midle of problem zone)Mod:USB/LSB TXPower:80 watts MicGain:Full PROC:Min when I press PTT I hear a noise from monitor to my headphones like woodpecker.
I hope I'm not bothering you with all this.

One more check and I give up. Check the 74LS145 decoder in the filter unit and make sure it's switching correctly. Also check for a stuck relay in the filter unit.

Clif

Date: 2003-02-04 02:12:00 UTC
From: seminolefan232000 <ne4xt23@qwickconnect.
Topic: 793  Message: 793

While running the shareware TS-850 control program, my TS-850 quite receiving (no receive volume) display very dim and appeared to be all 8s. the only function that seem to work are notch(the light lights when the notch filter button is depressed). The only other light lit is the MHZ indicator. Radio will change freq., tune, produce audio, etc. Appears to be a power problem. Is there an internal fuse that I have been unable to locate? This happened (as I recall) when I hit the scan function on the TS-850 programs control screen.

Thanks in advance for any help.

I would have to agree Bill. Very informative site. I have heard
Tyler on 14.178 and his audio sounds very good. I have considered
doing the AM balanced modulator input mod, but have yet to find an
affordable DSP-100 unit for sale.

What is your power supply doing?
Has the rear DC connector gotten warm? These get corroded and will drop a lot of voltage in TX and have to be replaced from time to time.

I used to run a lot of RTTY at 100w, and the Molex DC connector in the back of the rig (big one, for the main 12v line) got quite warm and started dropping a lot of volts... I had to replace the connector body and pins, and the DC cable. I now clean the connection about once a year with Cailube, no problems since.

# 801. TS-850 Erratic Power Output

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-06 02:59:02 UTC
From: k5lk <k5lk@ev1.net>
Topic: 801  Message: 801

Must be contagious! Seems to be quite a few threads lately of erratic power output on the 850. Mine has just started. The symptoms include power output that seems to drop to zero and then back to normal, changing every few 3-5 seconds or so. Doesn't seem to always do this though.... any suggestions on what might to look for?

Tnx de Bill, K5LK

Replace the DC-DC converter unit. Located under top cover, front left of panel as you face the rig, down low just behind the earphone jack.
x59-1100-00 is kenwood part number.
Use 1/2 of a 22 pin dip socket when you replace it, so you won't have to desolder next time.

<start>
Q3 on the BK SW board keys the SS line when the VOX is turned on. If
it is open, VOX keying won't work. If it is shorted, the radio will
want to stay in TX mode all the time.
Bill

Hi Bill
just read back some of my mails about the ts850 and I see one mention
Q3 on the BK SW board how would one check this component?
there is no visible signs of damage but that doesn't always work
what would I be looking for with a multimetter?

Hi Guys yet another problem on the 850 front
this time it was my clubs radio
Power supply went I think
radio shut down smell from power supply so disconnected all moved supply
away checked fuses on 850 and the inline 20amp on the pos line blown but
neg line ok. So get other power supply out connect up after replacing fuse
and now when I switch the 850 on nothing but the power supply starts to
draw loads of amps any ideas?

think I will stay away from radios for a bit

Are there fuses INSIDE the TS-850? If so I haven't found any.

Thanks again

Look at the finals, they won't take over 18-19v and they will short
to ground: IE high current.

Hi,I'm John, N1XLG.I've been thinking of upgrading my license recently and have been looking at various rigs.I can't afford some of the better radios and don't think much of the $1200 and lower rigs.Been through all 3 706's,had a 746,and an 847.The only one out the bunch that was worth the money was the 746 and Icom definitely shot themselves in the foot when they discontinued/upgraded this radio.Now they have a major hole in their lineup.
So I'm looking for a good HF rig that can double as a good SWL rig. And with some luck and perseverance,maybe I'll get the upgrade.So I'll be in the market for a nice TS450.

Hi John,
Welcome to the group. You will find lots of good information and
experience here with the 450. I owned one before I got my 850 and
they are a very nice radio. If you can part with a a little more $$,
be on the lookout for an 850. They are going around the $800 mark
and is one of the best radios on the used market. With the 6 khz
filter, the 850 is a real pleasure to use for shortwave listening.
Hope you enjoy your time in our group.

73,
Max

Only other fuse I know of is I THINK in the PA section.. should not affect all that other stuff. hmmm... thinking burned PC trace, this happens with external stuff sometimes shorting the 8v in the rig.

Have to second Max's opinion, love my 850 on SWL, especially with a big speaker!
the 12Khz filters make it sound like a vintage tube AM receiver like the SuperPro or the BC348..

Cheers for the advice Cliff Bill

Will get the radio checked out on club night Thursday and see what the guys find.

will say to them to check the finals. What exactly will they be looking for?
Some of the guys are good at repairs but maybe take them a bit of time to find the culprit so any help in doing so quickly will be great.

As for the supply it was a big one that was home made several years ago. I unplugged it and left for someone else to look at.
will take along my ps52 to do some checks incase the other supply I was using to test is faulty as well. Will let you know how I get on

Homebrew power supplies are a NO NO for these rigs, in my book... sorry mate but I just can't trust my rig to anything but a good old Astron.
Here's my method for checking finals, Clif can throw his two cent's in too:
Using a high-power (>250watts) solder gun, unsolder and carefully lift the base and emitter tabs of the finals.
Using DVM on diode check mode, check both ways from base to emitter (ground), collector to emitter, and base to collector. These are NPN silicon so they should show 0.6-0.8 volts forward.
You will probably see either direct short from collector to emitter or base to emitter; either one will draw excessive current.
Could be only one transistor is bad; it's ok to change just one in my book. Have never had a problem doing that.

I agree that's why I use my kenwood or diawa supplies at home

I will print this out and take with me and try this out myself see if I can find the culprit before the rest get in to the club

Cheers

John,

I upgraded from the 450 to the 850. Why?, I don't really know except I couldn't afford a 950! I have always been a true Kenwood fan, love that Kenwood audio. And having owned and been inside and out of the 450 so many times, I thought the 850 would be nice to have. And through good dealings with another member of the group, I was able to pick one up at a good price. The 850 has a few more features than the 450, such as multiple agc settings, multi-stage attenuators, the use of the IF filters in transmit as well as receive, built in signal monitor, IF output for transverter use (the display shows the actual frequency too!). I have done all the known mods to mine and they are really easy to work on. Loads of room inside. The receive sounds great no matter if your listening to SSB or shortwave broadcasting. It was a toss up between the 850 and a 940 I was looking at. I don't regret my decision one bit. The 850 is a great radio and I plan on keeping it for a long time.

Max

Technology wise, they are very close, nearly identical front ends, mixers, IF's etc... I think the 850's larger front panel allows more controls to be out front.

# 822. 850 versus 450

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-11 22:59:59 UTC
From: Bill Evans
Topic: 822  Message: 822

Read the QST performance reviews at the ARRL Members web site. The receiver in the 850 is probably as good as anything Kenwood ever made. Front end intermod performance is exceptional. I have both rigs (well, actually a 690, but it is just a 450 with 6m added). Love them both, but the 850 is far superior in many ways, with added features, better audio response, VBT( very good feature that is MUCH better than IF shift), IF notch, TX audio boost, keyer and that great receiver front end.

Bill VE4UD

Topic: 824  Message: 824

Anyone out there know where I can get a copy of the DRU-2 manual? I have been able to find a DRU-2 but it did not come with the manual. Perhaps if someone could make a PDF of it they could post it to the files section.

Thanks
Zack Schindler

Greetings Group! Getting back into Ham Radio after a break in time. Last new rig was a 940sat. All my gear was Kenwood.
I am an Advanced class....last of a breed:) Am looking into getting a used HF rig and like what I see out there. I like the TS50-570-450-690.....just not sure yet which rig I will end up with. I don't even own a power supply anymore so if I do get one of those rigs that don't have one built in..I'll have to get one of them too. After having a 940sat, I REALLY like the built-in tuners.
Any suggestions group??

TS-850 is my choice, unless you need smaller rig, then the 450... or for 6M, the 690.
The 450/690 would be better for field day and small shacks.
I like the 850 for the extra controls and larger size for the shack.

Well another 450 on the bench, bad memory battery, leaked or spewed onto the control unit PC board and ate up the trace that supplies 12v to the tuner. Not sure what to do about that except schedule memory battery changes before they leak... how would one do that? Can't predict the failures I guess.
Maybe put thin coat of silicone sealant on the board under the battery, if it isn't already damaged.
I now have piece of Kyner 30Ga wire wrap wire making the circuit, so the trace doesn't matter any more. I don't see any other traces that can get damaged...

I thought I had seen that the 2430's came in a manganese dioxide (or carbon zinc) formualtion. Almost all are now Lithium batteries which I believe are much less prone to leaking. In any case, here are some suggestions:

1. Put a label on the back of the radio with the date of last battery change and a warning to change the battery within 7 years or risk damage to the radio from a leaking battery (with specific details of what WILL be damaged rather than the typical CYA precautions).

2. Mount the battery in a remote location like the cavity next to the ATU where it can't ruin the PC board and line it with mylar and something absorbant like Kimwipe material (something that won't deteriorate over time or spread lint around).

3. Use a coin cell battery holder. Unfortunately, all of the holders I've seen have the "opening" at the bottom (relative to how it would be mounted on a TS-450) and a leaking battery will still leak right out of the battery holder. At least, this will make battery changing much easier for a user and will require the PC board to be taken out only once.

It would be a shame to see these nice radio's knocked out of circulation because of this problem and it looks like it will happen more and more frequenly now that the original batteries are starting to expire and leak.

Hi Guys
well the radio and power supply are both doing well
the problem was 2 wires that had been snaked inside they were both in the same area where the filter unit x51-3100 a sits down on to the x51-3100 b above the final unit
this radio hasn't been opened from new so must have been like this from the start of its life
One wire comes from filter b unit next to a resistor and the other wire I just cant remember but was that area and went down towards the final board

So now its sorted and working took a bit of working out as we had it working but everytime we screwed all together it wouldn't work took 3 attempts at it till we sussed it out

So thanks all for suggestions

I recently purchased a used TS-690SAT. It shows symptoms similar to those encounterd when the X59-1100-00 board is bad in the TS-850S. I looked over the schematic and could not find that specific board listed. I also looked inside the radio and could not find it. Can someone give me the physical location of the board, if it uses that board?

I looked at the skem yesterday, I could not find a dc-dc converter... must be another problem.
Is the power "pumping"? In what mode? Does reducing the rf power control help or hurt? Does it do it into a dummy load? have you checked your power supply for variance on the output voltage under load?
Any particular mode that it likes to do it in?
Some questions for ya!

Here is a a preliminary report...

Power supply voltage is ok.

The 690's RF output is in excess of what it should be. Over 200 watts. Both SSB and CW. I don't know if that is because of a defective component or if someone has been twisting on the internal controls. RF power control on the front of the radio does reduce the power to a reasonable level.

Power output in CW & FM mode is steady with no significant fluctuations in the ALC reading.

The problem seems to be in SSB mode. The output and ALC will fluctuate together while speaking into the mic. This seems to be in a regular pattern.

This does occur while using a dummy load.

Thanks for your thoughts on this Bill. At first I didn't bat an eye over this problem because I thought I knew exactly what the problem was, but the story is changing.

ALC and output power should fluctuate together, that's how they operate.
If you run in FSK mode, or FM or AM, turn power down using the power control. Adjust the Carrier until ALC is about midscale. Does it fluctuate then?
200W is too high, would not set higher than 150 watts. PO max is an internal adjustment. By the way, turning the power level all the way down takes you down to the min of 10 watts. Adjusting VR18 on the IF unit will allow you to drop that to 4.5 watts so that you are "legal" for the qrp contests.

I didn't state that as clearly as I should have. When I say the power and ALC fluctuate, I mean that they drop unexpectedly during transmit. While speaking into the mic, one minute the voice peaks are driving the ALC meter to 2/3 scale and the next minute there is no ALC deflection on voice peaks. When this occurs, the output power is significantly reduced. I have used several different microphones. It is not a mic problem.

The ALC does not fluctuate in CW or FSK mode. Neither does the power output. This seems to only occur during SSB operation.

Ok on how to set the low power lower. Which pot adjusts the top end of the high power? I intend to restore that to 100 watt level. I am not sure it has been intentionally increased. It may have been increased intentionally, or it may have gone "wide open" as a result of a failed component.

Adjust the Carrier until ALC is about midscale. Does it fluctuate then?

I got in on this late, but have you made sure that all the interconnecting
cables between the boards are making good contact, perhaps by sliding them
up and down slightly?

Kevin, I am going to bet that there is something wrong in the power sense circuit, the one that feeds the PO meter and ALC circuits. Possibly a bad diode; these fail a lot due to static. I use the 1SS101 diodes from Yaesu in most cases like this.
Do you have a service manual for this rig?
bill
"kevin_ka0i <kj558@...>" <kj558@...> wrote:I didn't state that as clearly as I should have. When I say the
power and ALC fluctuate, I mean that they drop unexpectedly during
transmit. While speaking into the mic, one minute the voice peaks
are driving the ALC meter to 2/3 scale and the next minute there is
no ALC deflection on voice peaks. When this occurs, the output power
is significantly reduced. I have used several different
microphones. It is not a mic problem.

There is also a possibility of RFI on SSB, fouling the ALC circuit.
Will get you your adjustment info when I get back to the shop tonight hopefully.
bill
"kevin_ka0i <kj558@...>" <kj558@...> wrote:The ALC does not fluctuate in CW or FSK mode.
Neither does the power
output. This seems to only occur during SSB operation.

Ok on how to set the low power lower. Which pot adjusts the top end
of the high power? I intend to restore that to 100 watt level. I
am not sure it has been intentionally increased. It may have been
increased intentionally, or it may have gone "wide open" as a result
of a failed component.

Adjust the Carrier until ALC is about midscale. Does it fluctuate
then?
> 200W is too high, would not set higher than 150 watts. PO max is an
internal adjustment.

Bill & list - I have done some further testing that contradicts my earlier thoughts. I hooked my digital interface to the rig via the microphone jack. I used that to drive the rig with a steady tone from my psk31 software. The output was stable and so was the ALC reading. In earlier tests, I relied on voice peaks using the same syllable to try to duplicate the same level of input on the microphone. Unless you are aware of a flaw in my test setup using the steady tone generated by the software, I may have to admit that the problem was my imagination. Although, I must say that the ALC operation in the TS-690 does have some different characteristics from my TS-850S.

This output of the rig is too high. I have verified that using an external watt meter into a dummy load and an actual antenna. I don't have a service manual for it.

Thanks for your help and thoughts on this.

OK Kevin, I will get you the adjustment info. The pot will be under the cover on the bottom that is held in place with two screws. The pots are not labled except with "VR" numbers which I will look up for you. You will probably also want to adjust min power to 4.5 watts instead of the default 10.0, for QRP contests...
Will get back to you this evening sometime.

Traces look ok, but where can I find a point to check the 8 volts? I read about 5vdc on the front panel connector.
Should that have been 8volts there?

Look on the RF unit abt halfway back on the right side. There are
three points 8A for the 8v supply, RXB for 8v in RX and TXB for 8v in
TX.

I wonder if this affects radios that have been off for long periods
more than it affects radios used often. If that's the case, might be
best to leave the radio on for a couple of hours each week if you
aren't using it just to keep the battery charged!!

I don't know about that...

I bought my 850 when it had only been out for two months. It's still got the original battery, and I use it about once every six months over the last 6-7 years since my daugter was born. Everything's still fine. (He says with fingers crossed....) Love the rig, just don't have time these days! Well that and working in RF during the day, there isn't the same motivation to play, as there used to be...

From: merckxist <kj5gt@cybermesa.com>
Topic: 856  Message: 856

Hello,
I want to introduce myself.My name is Al, and I have owned a TS-850S since 1996.It was purchased new from AES as a bare bones model.It has been trouble free and I have done nothing to it except add 1.8 khz and
500 hz Kenwood filters.I do have a couple of questions though.
The first concerns the life of the internal battery.I think the manual
says 4-5 years, and this unit is over that.I did the internal battery inspection I found in the archives, and measured 3.3 volts with a DMM.Also no signs of leaking.Am I lucky or is this normal? Anybody know a realistic service life for the internal battery, or is every case different?
The second concern is the gas discharge protector tube.While I had the
covers off, I looked at it.It had a thin gray/white line around the center of it.According to one of the postings in the archives, this means it has been damaged.Am I correct?I've tried contacting Pacific Coast Parts by email, for price and availiability, but have had no response from them so far.If Ineed to replace it, is there another source?
Well, thats all I have for now, I would appreciate any information any
one has on these questions.I havn't owned that many ham rigs, but the 850 is the best I've had.
Thanks,
Al, KJ5GT

# 858. RX audio quality

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-25 20:47:47 UTC
From: sp8fwb <no9e@arrl.net>
Topic: 858  Message: 858

I own one of the first TS-850. It works fine and I am happy with it. Especially, TX audio with speech processing and high boost is powerful.

The radio has a a ceramic filter replaced by YG-455S (2.4 KHz). Also, 2nd IF has a 2.1 KHz INRAD filter. On CW, there are 2 x 500 Hz filters. The rig does well in SSB and CW contests. I consider the selection of filters useful as any filter can be switched off for wider bandwidth. However, I find 2 problems on SSB in receive.

It is hard to adjust the carrier so that the signal sounds right with the 2.1 filter. When this filter is set right in SSB, it cuts too high in LSB, and low slope is out of range. Is it possible to adjust the range of slope tuning? I tried the pot on the right side of the top front board, but it is out of range.

The second problem is less than comfortable audio quality in SSB receive even with 6 KHz filters. I find that tuning is very critical for good legibility, and sometimes even adjustment by +- 20 Hz makes a large difference. Not so on FT-100 or K2, where the sound on receive is much easier to copy and tuning seems less critical. RX tone doesn't change much. Is it possible that the AF chain in TS-850 distorts?

73,
no9e@...

# 859. Re: Memory battery, pcb damage

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-25 21:33:51 UTC
From: Clif <avvidclif@yahoo.com>
Topic: 825  Message: 859

The battery in the 850 is a lithium battery and is not rechargeable. I don't think using it or not makes any difference.It is isolated from the radio by a diode. It seems the first few runs had battery problems, after that no problems.

To check the battery for leakage tilt it away from the board as far as possible and use a tiny mirror to look at the back. Leakage will be a white file around the crimped edges. If you can't see the back unsolder the top leg and look. It is that important. There are several vias under the battery and some are data bus lines, just a little corrosion goes a LONG way.

This note about leaking batteries also applies to the TM-742.

DSA301LAFILTER B/3D161ABSORBER, SURGE
this is the surge absorber tube that you are talking about.
I have them here if you are interested.
Contact us direct for more information at bbtech1@...
thanks
bill K0ZL
"merckxist <kj5gt@...>" <kj5gt@...> wrote:Hello,
I want to introduce myself.My name is Al, and I have owned a TS-850S
since 1996.It was purchased new from AES as a bare bones model.It has
been trouble free and I have done nothing to it except add 1.8 khz
and
500 hz Kenwood filters.I do have a couple of questions though.
The first concerns the life of the internal battery.I think the
manual
says 4-5 years, and this unit is over that.I did the internal battery
inspection I found in the archives, and measured 3.3 volts with
a DMM.Also no signs of leaking.Am I lucky or is this normal? Anybody
know a realistic service life for the internal battery, or is every
case different?
The second concern is the gas discharge protector tube.While I had
the
covers off, I looked at it.It had a thin gray/white line around the
center of it.According to one of the postings in the archives, this
means it has been damaged.Am I correct?I've tried contacting Pacific
Coast Parts by email, for price and availiability, but have had no
response from them so far.If Ineed to replace it, is there another
source?
Well, thats all I have for now, I would appreciate any information
any
one has on these questions.I havn't owned that many ham rigs, but the
850 is the best I've had.
Thanks,
Al, KJ5GT

The chemical leakage is a chemical reaction, most likely not affected by radio usage.

# 863. Re: [TS-850_450_690] RX audio quality

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-26 01:15:55 UTC
From: Bill
Topic: 858  Message: 863

I think the slope controls were optimized for Kenwoods rather broad 2.7Khz filters, which I am using with very satisfactory results. I am afraid that you are trying to use contest filters for higher-fidelity receive; perhaps, never the two shall meet!
The 6kHz filters let through ALL of the other guys' transmit passband and yes, you have to be RIGHT ON or it just won't sound right. I practiced on music SW or AM BC stations until I got it right. Try using a full range speaker on the rig, that will help.
I use a Drake MS-4 with a 2-way 4x7 coaxial speaker with spectacular results, also the Kenwood SP-180 is a reasonable alternative to the higher-priced Kenwood speakers, and is a close match cosmetically to the 850.
bill
"sp8fwb <no9e@...>" <no9e@...> wrote:I own one of the first TS-850. It works fine and I am happy with it.
Especially, TX audio with speech processing and high boost is
powerful.

The radio has a a ceramic filter replaced by YG-455S (2.4 KHz).
Also, 2nd IF has a 2.1 KHz INRAD filter. On CW, there are 2 x 500 Hz filters. The rig does well in SSB and CW contests. I consider the selection of filters useful as any filter can be switched off for wider bandwidth. However, I find 2 problems on SSB in receive.

It is hard to adjust the carrier so that the signal sounds right with the 2.1 filter. When this filter is set right in SSB, it cuts too high in LSB, and low slope is out of range. Is it possible to adjust the range of slope tuning? I tried the pot on the right side of the top front board, but it is out of range.

The second problem is less than comfortable audio quality in SSB receive even with 6 KHz filters. I find that tuning is very critical for good legibility, and sometimes even adjustment by +- 20 Hz makes a large difference. Not so on FT-100 or K2, where the sound on receive is much easier to copy and tuning seems less critical. RX tone doesn't change much. Is it possible that the AF chain in TS-850 distorts?

73,

That's a really great page, Larry. Only thing I would suggest would be that you let people know those pics are actually thumbnails. I didn't realize I could click on them until after I got through with the project!

I used your site to check my battery (for the first time) this evening. Unfortunately, I have lost about 3/4 of one trace on the PCB, but nothing that isn't fixable.

I'm thinking about using stick on velcro to secure the holder in the radio to keep it from accidentally rattling around if I take the radio portable. (I wonder if you could velcro the holder to the PCB board??). Anyway, real good page Larry!

Thanks!

Everyone needs to stock some #30 Kynar wire-wrap wire for patching PC boards.. this stuff works great for that. It's a little brittle but it's just the right size to lay along even small traces, and then you can secure the insulated part to the board with a small droplet of epoxy or silicone sealant.

Sorry to hear about your 850 Bill. As a past owner f the 830 I can tell you that you won't be disappointed. They have one of the best receivers on the market, and the transmit audio quality of them is fantastic. You can drive them hard all day and they won't blink.

Max

# 873. TS-850 programming query

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-02-28 06:16:18 UTC
From: w8nflists <w8nflists@yahoo.com>
Topic: 873  Message: 873

I've been asked to troubleshoot a remote control issue - the
software involved properly controls an Elecraft K2, but fails on a
TS-850S. The K2 ostensibly uses Kenwood-like commands.

I have the K2 command set. Does someone have the TS-850S
command set handy? I am in possession of neither radio,
personally and am troubleshooting via email (never fun).

Thanks!!!

73,

Dave W8NF

Hi Kevin, sorry I let your query slip through the cracks here...
VR15 on the IF unit adjusts max power out on the '690 on HF.
Also VR18 sets your minimum power. Factory setting is 10 watts, but I always drop it to 4.5 watts to make the rig "legal" for QRP contests.

I got in on this late, but have you made sure that all the interconnecting
cables between the boards are making good contact, perhaps by sliding them
up and down slightly?

Hello Bill and everyone!

Bill, if you have the time, why not scan those photo copy pages, zip them and post them on the files section for everyones future reference, unless of course it might bring/cause you copyright issues/problems.

I am about to update the 850notes.doc file with the latest compilation which includes whatever transpired from the date I posted it up to the latest significant post.

Thanks and enjoy your radio.

Dennis of the Philippines
also a member of the TS-440 EGroups

P.S.

I am still dreaming to get a TS-850. It is just simply so difficult to even listen to users/HAM operators who have them here in the Philippines. I only know of 2 HAM's who have them - all puchased outside the country. It does sounds exceptional amongst the Kenwood TRx I've listened to.

# 886. TS-450 keypad "off"

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-04 18:38:15 UTC
From: Makis <sv1bsx@hotmail.com>
Topic: 886  Message: 886

Hi to all,

the TS-450 of a frienf of mine has the follow problem:

it can be transmit and receive normally, change frequancy
from Main-Knob without problem.

But all buttons in the front panel are "deads", they not responds
and the YELLOW-Led of Antenna Tuner always "lights".

I've removed the antenna Tuner Unit, nothing changed.

I've replaced the CXD1095Q (IC), also nothing changed. The cable
of "keypad" connecting the "front-buttons" with this IC, which
it's a large square IC. (probably including A/D conv.)
I've no the ServiceManual of Rig, just the circuit diagram.

I've changed the battery with a new, nothing. The old was in good
condition, anyway. No problems on PCB surface below battery.

The "reset" also seems to not changing anything at all.

Any suggestion is welcome.

I'm speaking from memory as i don't have my manual handy but check it for a section on "mobile operation". There is a way to set the 450 so that only a few buttons are operational to simplify things when mobile. May be that someone has done this.

> and the YELLOW-Led of Antenna Tuner always "lights".
>
Hmm, not sure about this. But once I track my manual down I'll have a look.

let me know if this helps at all...

A wild guess, but do you think that maybe the "AT Tune" button is
stuck in the depressed position? You could check by looking for the
"AT tune" signal on one of the controller chips (I don't have the
service manual in front of me to see which pin that is, maybe you do).

Howdy,

Has anyone connected two TS850s together as stated in the operators manual? There is very little info pertaining to this capability and wonder if anyone has attempted to use a pair of them in this configuration. I enjoy the 850 and wonder if having two would be a better option than say like a 950 with a dual(watch/recieve) capability.

Thank you for your time and response.

# 892. TS-690 battery change

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-12 23:13:17 UTC
From: ksm91011
Topic: 892  Message: 892

Hello,

Just a note to the group, I have owned my 690 since it was
new in the early 1990s and got to thinking that perhaps the
memory battery should be changed out sooner rather than later.
This was partialy due to the disscussion of repairs discussed
on this group.

I emailed Bill K0ZL at B&B Technical Services. He had some
in stock and gave me a very resonable price that included
shipping. I sent him a check and recived the battery in about
3 days. The next weekend I up-ended the old 690 and proceded to
remove a handfull of screws. I had never hinged the front panel
forward before, so this was interesting. The ribbon connectors
looked a little fragile so I was careful to be gentle and not to
touch the contacts with my grubby fingers. Removing the old battery
was required a little rocking as one terminal has two contacts and I
only have one soldering iron. The other contact came out easily.
After a quick cleanup with solder braid and poking a solid wire
through the holes I easily soldered the new battery in place. I was
back up and on the air in about 1.5 hours with breaks. I did not
even lose my channel memory!

I will now ignore any posting about battery problems for the next
12 years!

Ken

Why??? When it dies you loose your memories, that's when most people change them. No reason to do otherwise.

Gee Ken, thanks! <blush>...
I would make it 5 years with these batterys... You might go back in there and slide a piece of electrical tape under the batt, center it so that the tape catches any leakage... sorry I didn't mention that to you earlier.
Good idea for the rest of the group.
Hey congrats on doing your own thing there, saved you enough to take your YL out to a real nice dinner! hi hi

Because there are reports by some folks that their batteries have been leaking even though they still have not lost thier memories.

# 898. Question on the SO-2

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-14 00:12:59 UTC
From: lostyank
Topic: 898  Message: 898

Just a question. Has anybody actually installed one of these? I understand the frequency stability/aging aspects, but is this worth the cost? Is this just an option for people who are going to be using their rig in "demanding" situations? I checked out the PLL oscillator today and it was running well within tolerance @ 20Mhz. Has anybody found it useful? I have looked at a few TCXO's at various sites with the same/similar specs that would probably suffice as a replacement for the SO-2. Just wondering!

Thanks in advance.

The battery leaking is with the original batteries and only within a limited run. Replacement with a newer battery should alleviate that problem as long as you don't damage the battery by soldering to it.

FWIW, the battery leakage that causes damage is primarily limited to the TM742 and the TS850. The TS440 batteries leak but I have never seen one cause damage due to the different construction.

Does the battery have a date of manufacture on it? [ Just in case it's been sitting on the shelf for a year or two, you might need to not worry for 10 years. ;-) ]

Good question.
My '850 "drifts" from 20hz low to less than 1 hz off, after about 40 minutes. None of the applications I have run ever required anything better than that, including phone nets, RTTY, and Pactor operation.
I installed an so-2 for a guy, and checked it from cool start (room temp about 55 deg) up to room at 72 (wood fire warmed up the shop) and rig covered with dishtowel on receive for 8 hrs. His "drifted" only about 2 hz. Mine seems as stable as his during the normal operating cycle (rx, tx, rest, etc).
I would spend my money on something else, like a good external speaker or something. But that's just me.
73!

I show the start of corrosion on a 450 at my page:
http://www.geocities.com/lfnca/450bat/450sat_battery.htm
and have heard of 450 battery leaks causing the board to be replaced.
I am sure the lithium cells were not designed to last forever. I
would be interested to see what the manufacturer specs are. maybe
I'll go surfing tonight :)

Good pictures Larry.

The diode you show with corrosion on it was the diode I found to be "leaky" when I ran into the excessive battery drain problem I had several months ago. It caused a current drain of 2mA when the rig was off. That drained the first replacement battery in less than a week, then a pair of AA cells in a battery pack in a couple of months.

After finding the culprit and replacing it, I ran it for a few more months and found that the AA batteries still measured with full voltage (no measureable drain). I replaced the AA pack with a coin cell holder which cost $2 from DigiKey and the pin spacing is just right for the TS-450 PCB. Now I won't have to remove the PC board to unsolder the battery, just swing out the front panel and slip a new one in about 5 years from now whether it needs to or not.

You probably have a busted lamination. Replace the transformer is about all I can think of, unless you want to try dismantling it your self and giving it a varnish soak.

I have my backup in line now Bill, so I have all kinds of time to fix it. Exactly what do you mean by a "varnish soak"? I would like to fix it because it looks much better than the homebrew backup supply.

Max

Might be easier to just replace the transformer, or find PS52 on ebay.
I have not tried taking apart the JA style transformers, not sure it can even be done.
Check for loose hardware inside, maybe just torquing down the transformer mounting nuts will do the trick.

Having been the proud owner of both of these great rigs, I would still vote for the 450S. Although the 440 is a great radio, they are prone to VCO problems (the dreaded all dots on the display!). The 450's are completely different inside.

If you can save up a bit more, go for the 850S. Enough can't be said about these radios. Probably the best one Kenwood ever put out, and they are going for only a few hundred more than the 450's. I don't think you will make a bad decision with any of them.

440 is more likely to have problems (all dots on the display etc), but the 450 has had it's share with DDS and memory battery leakage. Buy either with care.
Go on looks and features and filters.

Hello,

If it is a loose/cracked lamination you can try a couple of big lock-
washers under the transformer mounting tabs after removing the unit.
As Bill said, re-torque the transformer and I've sometimes found that
this will displace the lamination just enough to shut it up. If that
doesn't work (or it's a loose winding), better off replacing it. All
the usual PSU safety precautions should be followed of course.

# 917. Re: [TS-850_450_690] Digest Number 244

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-20 21:48:14 UTC
From: D.Cy Gacuzana
Topic: 917  Message: 917

Hello all, I purchased my 850S/AT last year in the Fall I think it was, I know it was much too early for Christmas. But it scared me so i left it in the box when I got it home. Besides, I was happy with my simple Corsair. No way to mess that up, like hitting Xit instead of Rit, and for CW "tune up" there is no CARrier adjustment. There's one knob for power, called DRIVE.
I couldn't believe Ten Tec QSK could be matched anywhere by anyone, except I heard rumors that the Elcrafts and the 850 and even the 570 are "...real close."
The Corsair sang it's last song last Saturday. Died in mid QSO just turned herself off. Funny the last word it did send was the word OFF, while I was describing my dipole as being "...fed OFF..." and then she just turned off. Didn't get the whole phrase of FED OFF CENTER even, only FED OFF, and like magic, she gave up the ghost, after 2 trips to Tennessee for repair in under 1.5 years.
Being forced to use the 850 I tentatively took her out of the box... fetched the Astron RM 35 I got for her purpose, plugged it all in, turned her on, and was bedazzled by sound and such.
Boy, is that some Class Act or what? The VFO is smooth beyond description, and that is a REAL KNOB. No rubberization/plasticity to that work of art alone.
Honestly, I wasn't sure if I was putting a signal on the air, the QSK is THAT QUIET.
ALL I CAN SAY IS WOW.
I'm sure some minor issues will develope, and when they do, I'll ask here.
So for those considering an 850, I must say, compare the QST measured specs to ANYTHING IN THE UNDER 1000 OR 900 DOLLAR CLASS. Awe heck, compare it to anything in any class regardless of price, how about that.
I'm so very impressed, tho I miss the simple what you see is exactly what you get, that the Corsair provided. But, now I can work split!
Really like the general coverage receive too. Nice to hear all the various Spins and Viewpoints being placed on current events.
I think one could easily, easily spend much more for a radio, but the extra money won't result in better performance, either on receive, or CW transmit. [haven't hooked the mic up yet but I think it's around]. One could spend over 3 grand, and except for dual receive functions, perhaps some minor DSP comfort [the Notch/Slope Tuning seems adequate for digging out anything possible on the 850], the 850 still is up there at least even with the most expensive Amateur rigs EVER made, in the past and or compared to anything current. I think it may outperform anything current, too!
I'm stoked.
Thanks guys. I'll be in touch!

THANKS FOR USING TS-850_450_690@...

Having been the proud owner of both of these great rigs, I would
still vote for the 450S. Although the 440 is a great radio, they are
prone to VCO problems (the dreaded all dots on the display!). The
450's are completely different inside.

If you can save up a bit more, go for the 850S. Enough can't be said
about these radios. Probably the best one Kenwood ever put out, and
they are going for only a few hundred more than the 450's. I don't
think you will make a bad decision with any of them.

Max

Subject: Re: Decisions!!

440 is more likely to have problems (all dots on the display etc), but the 450 has had it's
share with DDS and memory battery leakage. Buy either with care.
Go on looks and features and filters.

Hello,

If it is a loose/cracked lamination you can try a couple of big lock-
washers under the transformer mounting tabs after removing the unit.
As Bill said, re-torque the transformer and I've sometimes found that
this will displace the lamination just enough to shut it up. If that
doesn't work (or it's a loose winding), better off replacing it. All
the usual PSU safety precautions should be followed of course.

I have to agree with everything you said. It's definitely the best radio in the under $1000 category.

I've used quite a few different rigs at other peoples' QTH's. I've used the TS-940, IC-751, FT-1000MP and a few others. The TS-850 is one of my favorites and definitely worth at least what I paid for mine!

If you do the mod to move the CW Sidetone level to the front panel MON control, it will make it even better for full-break-in. That way you can balance your sidetone with the band noise and really make it transparent.

Hi folks

just a note to say thanks to Bill cliff and others for the help they give on here.

The knowledge from these guys is top notch if it wasn't for them my ts850s would still be sitting dead.

I know have my ts850 working thanks to Bill for supplying me with countless help and ordering the parts for me Kenwood uk do not do parts.

I also have help a few local Hams in Scotland that had similar problems weird smell and was the surface mount cap on the car board
ALL INFO CAME FROM HERE

So Keep the good work up guys

Here's something: My 850 sends a pronounced whistling, whenever the RF Gain is turned down, past 10:30 [am or pm? hi]. However, I do not know, whether or not it's normal to have no gain at that point anyway- in other words, at 10:30, a bit before then, the receiver receives nothing anyway, except quietness, some weak hiss if the AF is turned up. So I'm thinking, well, it doesn't matter anyway. Because I never put the RF gain down there. Wondering if it's normal for no receive when the RF gain is below 11:00/10:30?

THANKS FOR USING TS-850_450_690@...

# 928. Rig oscillating on TX in 40m band

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-31 03:57:43 UTC
From: Max
Topic: 928  Message: 928

I'm having a strange problem lately on 40m when transmitting. On all modes when transmitting, the radio goes into a severe case of feedbacking, causing the power to drop and the RF actually sounds like it is oscillating. All modes the same. Only does it on 40m, soes I thought it might be the antenna. Hooked up the dummy load and no change. This has really got me baffled. All cables are connected securely.

Any ideas what to look for?

# 929. ...Oscillating update

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-03-31 13:51:53 UTC
From: Max
Topic: 929  Message: 929

After retuning the ALC, I've got the oscillations to stop. With a tone (1 KHz) fed into the mic input the radio will do a little over 100 watts out, however average SSB talk power is only around 50-60 watts. Carrier power on FM is just over 100 watts on all bands with no oscillations. I am using a D104 mic, so I figure the average SSB should be higher. The only pots adjusted were VR14 (ALC voltage) and VR7 ALC (power output). The output is the same on all bands. What causes the oscillations when the ALC is turn up too high? Am I missing something in the tuning?

Help!!

Max, with no ALC you are running the rig wide open. It might oscillate under those circumstances.
Your average "talk power" should only be 20-30 watts with processor off. Average talk power is not reliable means of measuring due to individual voices, mic characteristics and meter response time constants. Only a true peak reading meter (or the "peak hold" function of the TS-850 internal meter), or a scope can be trusted when checking SSB output power. That, and other hams' reports of your audio quality.
I just had a very nice QSO with a fellow in Illinois last night, I was running 5 watts PEP, processing and high-boost ON. He gave me a 5x5.

Yes it would go away when I turned the power down. What I didn't understand is it would only do it on certain bands. I first noticed it on 40m. Whe I retuned and corrected the problem, checking output on the other bands, I found it wasn't constant, ex. 15m was only putting out 20-25 watts. I know have it running 100W carrier power on all bands, average SSB around 60W. As I said with a tone or on a whistle it peaks over 100W, so am I to assume all is well? I love working on these problems, except my day job always seems to get in the way!

Now try it into a dummy load.
If the problem persists, there is a problem with the rig.
If the problem goes away, you have rfi in the shack, possibly something changed on the antennas and RF levels have gone up around the rig.

# 935. Hello all from a new member.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-04-01 20:51:10 UTC
From: MM0ANT
Topic: 935  Message: 935

Hi all,
I've just joined this group. I've had my 850S for about a year now
and an really enjoying it. I hope everyone is well and enjoying their
radio's! I've just moved into a new house and am about to rebuild the
shack from scratch again; while I am at it I'm introducing new and
changed hardware so some experimentation is about to happen!

I was on the lookout for information in relation to getting a transverter
level output from the 850 to drive my MMT144/28-R at 300mW.
I have looked in the files side and found a mod to allow splitting
the final drive out by using a couple of phono connectors. To be
honest I don't want to attack the rig to that level at present so I will
probably go the external 20Db attenuator and PTT switched relay
for antenna change-over route. This would be completely external to
the rig and is my preferred option at this time.

If anyone has any suggestions or thoughts I'd be glad to hear them all.

Thanks for listening! :)

Robert

Robert,

I did the above mod to my 850 to drive my Yaesu FTV700 transverter. The setup works like a charm. I drilled and installed the phono connectors next to the IF OUT jack on the rear panel. The RF drive cable going to the final amp is located right there. Just a case of snipping the cable and connecting it to each plug. I use a short jumper between the plugs when the transverter is not in use.
The most time consuming part was removing the rigs cover!

73,
Max

Something I can't seem to find out anywhere...
What power level is this drive to the final stage amplifier?
If I do this I am looking for around 300-500mW to drive the
transverter.

Robert,
I believe it is only around 2 mW. It drives my transverter nicely to
10W output.

Anyone know the part numbers for the small coax jumpers used in the Kenwood rigs? These are the grey, RG174 size coax cables with the funny little shielded pin-plugs on the end.

Need one about 8" long for the "AT unit used on receive also" mods.

thanks!

Bill

Hey Bill,

I salvage the cable that went to the IF OUT jack. I believe one end
of it plugs into CN26. Since I won't be using the IF OUT for
anything I wanted to put it to good use.

# 944. ALC issues

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-04-04 15:45:35 UTC
From: Max
Topic: 944  Message: 944

Let me outline my problem..

As noted in previous posts, my 850 started osillating on certain bands, mainly 80 and 40 meters. After determining the ALC was too high (thanks Bill!), it was retuned, which solved the problem. I am curious though why it only oscillate on certain bands. I can turn the power up higher and be fine on most of the bands, but oscillation occurs on the problem bands. Is there a band specific adjustment that can be made to fix only the bands in question? When I turn the ALC down low enough so there is no oscillation on any band, the radio will only put out around 80-85 watts CW keyed. Should it not do more? And at this power level I am only getting 40-50 watts average power out on SSB. Again, is this normal? After putting the thing all back together now, I now notice that the SWR meter reading shows a 1.5 to 1 reading into my dummy load!! Don't know what has happened here. I think maybe the best approach is to give it a complete retuning as per the service manual. Problem is that the Japanese to English language translation can be confusing at times.

General call for help goes out here...

Do a step by step alignment on the TX side but don't forget the ALC voltage adjustment at the start. That should cure it. If you don't understand some of the alignment I can explain it but if you don't have the test equipment called for don't even start. Let someone do it who has the equipment.

Another note. Go thru the alignment step by step, TWICE. Take your time.

Clif,

I went through it this afternoon, and everything looks good. I am still only averaging around 50 watts during speech but a light whistle will produce about 110W on my test meter. No oscillations of any kind. If I inject a 1 khz tone into the rig, it easily does over 100W out. The SWR error was due to TC1 on the filter board. Realignment fixed that. So now all looks good, kudos to you and Bill. I was just under the impression that it should be averaging a little more output, but as Bill mentioned different mics garner different results. I am looking for a Heil to put on it, getting kind of tired of the D104 twang.

73 all,
Max

Thanks everybody for the suggestions, tips, & excellent documentation of repairs.

Soapbox on...
As a communications electronics professional with +25 years of maintenance & repair experience, I prefer performing _preventative_ measures rather than corrective measures. Failures usually don't occur at a convenient time.
Soapbox off...

I have inspected the battery in my TS-690s, purchased new in 1993. It is slightly leaking with _no_ corrosion forming or evident yet. Even though the battery & pc board are mounted vertically, a couple of small leakage 'trails' have defied gravity & built up to the pc board. I've removed & cleaned this up with alcohol & a swap.

Replacing the battery with a holder sounds like the most professional solution to me.

Roy, can you advise the Digikey part number of the coin cell holder that fit the existing pc board holes & which coin cell you are using?

Thanks & 73

> I replaced the AA pack with a coin

Agreed. I am instrumental in the creation and maintenance of a PM process at a food plant in the Denver area.
Most electrical failures are of a "random" nature however, and cannot be predicted, especially in today's noisy environment.
There are things that we often need to "run to failure", such as the final transistors in your radio. It would be silly and quite un-economical to replace these every X years, just because "time's up". If you use this approach, it's called (guess what) "run to failure". It might be summed up in the common saying, "If it ain't broke, DON'T FIX IT".
When you have a track record of failure, for example the batteries in the 450/690/850, then you begin to get an idea of the MTBF or Mean Time Between Failure of that particular part or assembly. In this case, it seems to be less than the 10-12 years we have seen with other types of battery. Based on this knowledge that has been developed here in the group, you can do some preventive things such as changing the memory battery every 5 years. Or lubing your VFO encoder shaft yearly, blowing dust out of the rig, and things like that. This is called "preventive maintenance". It's usually calendar-based, done every so often on a regular basis. This could also be called "Fix it before it breaks".
There is another approach to systems maintenance, where you identify failure spots (either based on engineering studies or, more likely, history of failure) and then go in and not only repair it, but re-engineer it to make it less likely to fail or to reduce the consequences of failure. When we replace the memory battery with a battery holder, we are not only replacing the battery but making the system better by reducing future maintenance costs (less time to do the job), reducing system disturbance (lifting the control board, soldering, exposing the rig to static damage etc.) and by isolating the battery from the PC board (reducing consequences of failure... no more board corrosion). This is called in some maintenance groups, "precision maintenance". How could we best describe this? "Fix it so it won't break again".
If we were to have some sign that our transistors were ABOUT to fail, or that the VFO encoder shaft radial play is exceeding some set limit like 0.020", and do our repairs based on that, that is called "predictive maintenance". This could be called, "Fix it because it's gonna break soon". We could use something like a network analyzer to check our coaxial cable and antenna once every 6 months or whatever, and by comparing past results with today's we can make an intelligent decision to replace the coax and connectors based on their performance trends, rather than age or failure mode. This may not make economic sense for the average ham, but if your station condition is "mission critical" (MARS, traffic, contesting, APRS node, etc), then it may be worth doing.
A "great" maintenance system is not entirely "run to failure", "preventive", "predictive" or "precision" based. It will instead have a MIX of these approaches, using the combination that is most effective and makes most economic and strategic sense for each system, unit or sub-assembly of a unit. This applies whether you are maintaining your car, a ham station, or an oil refinery.
73,
bill K0ZL

I replied offline, but I might as well let everyone know:

105K-ND HOLDER, BATTERY COIN 24MM 1-CELL $1.12

Here's the page from digikey:
http://dkc3.digikey.com/PDF/T031/0950.pdf

It's a part from Keystone Electronics.

The pin spacing is 0.807" or 20.5mm

Make sure you get the one cell holder and not the double height (two cell holder). Even though there are only two pins at the bottom of the cell holder and the original TS-450/690 battery has three, you'll notice that two of the pins are tied together on the PC board. When you take the battery out, do a quick Ohm check across the diode closest to the bottom of the battery to make sure it isn't shorted out in the reverse direction. That was the part that caused my battery drain problems and it is also the first part likely to get damaged by a leaking battery.

Digikey will charge an extra $5 for orders less than $25 so you might want to see if you need any other electronic "goodies" while you're at it.

# 954. PK-232 to TS-690S Data Cable Needed

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-04-07 14:44:32 UTC
From: Paul N. Gayet, AA1SU
Topic: 954  Message: 954

Hi Folks,
I have just joined this group, and I already have a question. I would like to know if there is a cable available to join an AEA PK-232 to the 13 pin din connector on the back of the TS-690S. I want to do some RTTY contesting using FSK, instead of AFSK, which I can do now.

I looked on the MFJ web site, and then e-mailed their technical support line. They have:

"MFJ-5213 Open end 13 pin din Kenwood connector" and
"MFJ-5100X Data Radio Cable - PK-232"

They e-mailed me back this morning, and said that Yes, this is the combination that I would need from them. I would splice the two together, I think.

Do you have any ideas for a pre-made cable? I can also make one with local parts too, but prefer not to.

I have been wanting to do the same with my PK-232DSP and TS-850S.

I bought a couple of the plugs last summer at a hamfest but haven't put
the cable together yet.

Has anyone else done this and are there any particular precautions about
doing it?

From: Paul N. Gayet, AA1SU
Topic: 954  Message: 957

Thanks Bud,
It looks like that will do the trick. Plus, I see another cable that I need to get back on local packet with my Icom Handheld. My old one fell apart. I'm not much of a cable maker here. :-)

Congratulations on the purchase of your 850. They are a great
radio. Regarding your question on the best mic to use, you are only
limited by your pocketbook. I have used everything from D104's to
studio mics and they all sounded good. If you want to spend the
least amount, go with a Heil GoldLine. Or you can spend $$ and get a
studio condensor mic with EQ setup and the whole works. Not really
needed and I speak from experience. I would save some money and pick
up a Heil.

Regards the filter question...yes the filters can be switched into
the transmit path. You have to push a couple f buttons while turning
the power on to access the menu. It is all explained in the owners
manual.

Have fun,

Max

Congrats! Kenwood MC-60 works great, also the Heil Gold line, and many others. I use an old Astatic 10DA head with very good results, good compromise between fidelity and "talk power". Careful running "high boost" and "compression" together.. don't run compression much higher than "barely" if high boost is on, otherwise your "frequency neighbors" will complain! Try QRP at 5-10 watts with compression at about 5 db and high boost on. Don't tell anyone you are QRP until after you get your report! hehe There is a power-on menu change that will allow the filters to be changed in tx as well. Use caution here, as when you run 6kHz filters, you will be on double sideband! If you can't find the info I will look it up. I think there is a 850 website in our "links" that will point you right to it. Don't have the info right handy. Anyone else? 73 and enjoy that rig! bill K0ZL

Is this a trick question or is this a pop quiz?

I thought the AIP (Advanced Intercept Point) is Kenwood's terminology
for turning the preamp off on the recieve end of the rig. It helps
reduce intermods and overload when you are trying to bring in a weak
singal in the proximity of a strong adjacent signal. Yaesu uses some
other cracker jack name. Icom simply has a "preamp on" switch/indicator.

How's that?

If you can't find the info I will look it up. I think there is a 850 website in our "links" that will point you right to it. Don't have the info right handy. Anyone else?

Kenwood TS-850 I.F. TX Bandwidth Power-On Menu Settings:

1) With the 850 turned off, press and hold the "SCAN" and the right "M.Ch" buttons
simultaneously while tuning on the radio.
2) Select menu 1 by rotating the "M.CH/VFO.CH" knob.
3) Turn the option to "ON" by pressing the "UP" button.
4) Press the "CLR" button to exit the power-on menu.
5) On transmit, you can now select the following filters in the 8.83MHz i.f. resulting
in the following on-air bandwidths (with the DSP-100):

None = 6kHz TX bandwidth (with DSP-100)
6k = 5kHz TX bandwidth
2.7k = 2.4kHz TX bandwidth

73,
Max

The AIP is the Inverse of the Pre-Amp in an Icom. A Kenwood is all systems go in normal mode. The AIP turns off a preamp before the first mixer BUT after the bandpass filters which limits the signals getting to it.

The Icom is reversed. In the Icom to get maximum RX the Pre-Amp must be on. The trick is the preamp in most of them is before the RX bandpass filters and amplifies everything.

Depending on the individual rigs an Icom with the preamp on is the same as a Kenwood with the AIP off. The Preamp gets the Icom to where the Kenwood starts and the AIP backs the Kenwood down to where the Icom started.

Clear as mud. I don't have a clue for Yaesu's name for this fracas.

I think Kenwood just wanted to be different. Having a "direct feed mixer" is really cool, makes the rig sound better on the low bands, reduces all the noise and allows the AGC a little more headroom I think. bill

From: D.Cy Gacuzana
Topic: 977  Message: 977

Lately, especially during full break in, the Receiver does not come back, rig just stays in Tx mode... sometimes taping the straight key I also have hooked up brings it back and I can hear again, but often I must turn the radio off and back on again to start receiving, after transmitting. Really puts a damper on things, might anyone have ideas as to the cause and solution? This is an 850S/AT Any input is much appreciated...Darin, w3dcg, Atlanta. GA.

Darin, the keys to t'shooting any T/R problems in the '850 is to use the service manual, and identify the T8 and R8 lines on the IF unit. By measuring these and determining that they are switching correctly, you can check a multitude of things. Next is the "SS" or keying line; there are about 5 or 6 transistors that can "hang" and keep the SS line low, just as your PTT or VOX does. Any of these transistors can get leaky or short, causing the rig to stay in modes that you don't want. We can help you walk through the rig if you want; Highly recommend a service manual if you don't have one. Without it or an intimate knowledge of the '850, you won't get far. There are a couple of guys you can holler at if you need help to get the rig fixed at a shop. 73, Bill K0ZL

Does it do it on all bands Pete, or just 40m LSB? What filter setting
are you using on transmit?

The first thing to check is the slope tuning knobs. The smaller one
should be fully clockwise and the larger one should be fully
counterclockwise (or do you say anticlockwise in England?) :)

If I understood his first post correctly, he was talking about his transmitted audio through the monitor circuit. Pete, please clarify. Is it when you are receiving or transmitting?

That could be. I hardly ever use the monitor on mine when transmitting SSB, but then I hardly ever transmit SSB! :-)

I checked mine out and it's OK. That's a problem I'm unfamiliar with.

Alberto,

If your 450 is putting out factory spec power, it should be more than enough to satisfy the drive requirements of most amplifiers used today. As Randy suggested, check the output of your rig first to see if it is within spec. Anywhere in the 80-100 watt range is normal. If it is less than that (CW carrier power) you may have a problem with the rig. What are the drive specs for your amp? Input power vs. output power?

Max

Hi to everybody, thanks for your reply......

Actually, my IC-740 give me a little bit more of power (120 Watts) and
my amplifier is a FL-2100Z......

It run two 572B tubes....

With my Ic-740 I got 600 Watts PEP output.

With my Ts-450SAT I got almost 500 Watts PEP....

I am using a YS-60 Wattmeter....

Thanks.

Main problem is RF feedback.. Best to use the FSK input in the back, and use lotsa ferrite cores here and there... After you do your hookup, get on ssb with someone or use the monitor function, and between antennas and dummy load, experiment with where you put your ferrite. I ended up with a core on my station ground lead, believe it or not. Be sure to check all bands. 10 and 20 seem to be the worst. b

I hate to disagree, but all my Kenwood rigs have run about 105-110 watts output. 80 watts is 20% below rated power. If that was all I got into a matched load with a Bird meter, I'd turn it up.
Just my opinion!

I hate to disagree, but all my Kenwood rigs have run about 105-110 watts output. 80 watts is 20% below rated power. If that was all I got into a matched load with a Bird meter, I'd turn it up.

I was trying to make myself feel better Paul! But I agree with you. I am positive I was getting about 125W out of my 850 before. Now if I turn it up any higher than 100W it goes into oscillations on certain bands. I have checked the ALC voltage settings as per the service manual and everything is within spec. I can't for the life of me figure out why I am not getting the output I used to.

Any ideas from the group??

1. What power out are you getting at 14.2 MHz into a dummy load in CW mode??? (Using an external meter)
2. Is it the same on all bands?? (10m may be down 10 watts)

Hi Clif,

Output on 20m was around 90-100 watts. It is the same on all bands.
My memory may be failing me but I thought before I was easily getting
125W. If I turn VR7 up it will deliver more power but breaks into
oscillation.

I have had a TS850 SAT since 1995 and have had this problem since ...
ie. The display marks the frequency 200 kcs off the 'real'
frequency ... so say if i'm spreaking to a station on 21.150,00 Mhz
my VFO readout has to be 21.150,20 Mhx ... this is on all bands ...
suppose i need to align the settings .... any ideas how to go about
it please? I can live with this and love my TS850 ... but would feel
better if the VFO is correctlt set.

Thanks and 73s de Herbert = 9H1BD

Herbert,

With the frequencies you give in your example, your radio is out 200 hz, not 200 khz, which would be real bad. Have you checked alignment with WWV? Do you have access to a frequency counter? Could be your 20 MHz oscillator is off a wee bit.

It's only 200 Hz, not 200kHz! This is easy to fix, just adj the master oscillator frequency. Remove the covers from the rig. Turn on , and cover with a dish towel to allow the rig to warm up as if the covers were on, about an hour. RX mode is fine. Locate a small hole in a cover on the left side of the rig, about 2" up from the bottom of the rig and 5" from the rear. This should be the master oscillator adjustment. Tune in a known-accurate broadcast station. On SSB mode, 6kHz filters, notice that when you are indicating their exact frequency, there is a noticable "beat" tone, very low (200Hz). With a non-conductive tool or insulated screwdriver, carefully adjust the reference oscillator so that the beat note lowers, approaches zero, and then basically stops. You should be right on. Confirm by checking some other stations, then on the ham bands. 73, Bill

Hi I'm new to the group having owned a TS-850 for barely two whole days! I'm sold on it already and wonder how I managed with other, non-Kenwood rigs!
I have a question: The CAR control clearly has some cotrol over the carrier but the hand-book wastes few words on it. It merely advises that is should be set so that it lies within the ALC red zone.
can anyone pse expand on this. It seems non-critical but I would like to know exactly what it does. My main interest incidentally is CW and digital modes.
Although some find it inconvenient to have the side-tone level adjustment inside the set what I find far more irritating is the coarseness of the keyer speed control. has anyone a mod to improve this pse? The only other niggle is that you can't transfer the RIT setting to the main VFO as on for example, the IC751.

A really great rig.

CAR is tied into the power output along with PWR. I set my PWR and CAR at 5 and this gives me ~ 60 watts SSB out. Your ALC, on the meter, is adjusted by the MIC and on SSB I have mine at 2. MIC is the audio gain--too much and you distort, too little and you are soft and underdriving the power out. Brief, but an answer for you. In the owners manual it should/does give definitions and operation procedures for the functions, but probably not a recommended setting(s).

Thanks for your help fellas, I doubt whether I shall bother with the sidetone mod because I only use headphones. Maybe change my mind after the honeymoon period and I start taking covers off to mode the ATU to feed the receive side.
CAR sounds like it controls the drive to the PA, I'll d'load the hardware manual and have a peek. Thanks for the info on its adjustment -- so far it's been trial and error.
No-one mentioned the keyer speed control -- you can go from 15 to 35wpm by just breathing on it! perhaps a resistor in parallel with the control pot might do the trick if it is getatable.
As I said it's a very impressive rig and even after another day I'm still impressed!
thanks again

# 1015. TS850 - tuning knob moves

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-04-30 09:26:40 UTC
From: Paul B. Peters, VE7AVV
Topic: 1015  Message: 1015

I have two 850's and both appear to have the same lazy tuning knob syndrome. With the clutch on the knob set to where I like the tension (about the halfway point), the knob continues to move a few kc the moment I stop tuning or take my hand off the knob. It's especially noticeable if the set-screw that holds the knob on is at the top or side of rotation. The dial will turn until the set-screw comes toward the bottom of the arc. This problem is more annoying than anything else but I would like to know a fix. I think the knob should stop turning and stay put rather than move.

Several months ago I did read something about a small tab just behind the tuning knob that could be bent out slightly to add tension -- any thoughts?

Sounds to me that the tension setting you like is too loose. Hahahaha! You may have to just give it up and set it tighter.
Same way with me and 450sat. Had to give up the power steering in order to stay on the track, so to speak.

My 850 also had the drifting VFO problem.
I lived with the problem for a while then one day it was all OK
when released off again.

>Several months ago I did read something about a small tab just behind the
>tuning knob that could be bent out slightly to add tension -- any thoughts?
>73 de Paul, VE7AVV

As you asked earlier about the brass fingers on the rear of the knob,
I've, erm, taken my knob off and taken a picture of it... The picture will let
you see what we're all on about. You'll need a 1/16th inch allen key to
remove your knob.

www.mm0fvc.co.uk/mm0ant/photos/850/850knob.jpg

I think I'll rapidly change the subject before I get filtered! :)

The power control varies the power output and affects all modes,
typically 10-100 watts out. The Car control varies the injection
level of the Carrier Oscillator. It should be set to midscale of the
ALC range in CW mode. In SSB the mike gain does the same thing and
also should be set to midscale of the ALC range.

The allen screw in the knob is a 1.5mm. DON'T use a 1/16th, if it's tight it will strip it.

Thanks for the info Roy!

This coin cell holder mod works well. The fit is a little tight with the surrounding components, but it works & the holder keeps the battery snug. DigiKey doesn't carry the batteries to go along with the holder?!?, so I picked up a 2430 coin cell from Radio Shack.

I emailed my reply to you individually yesterday through the Kenwood mailing list, but in case you missed it. Yes it does work. In fact the SM-220/BS-8 works with the 820, 830, 940, 950, and 870. Unfortunately, Kenwood decided not to put the 8.83 MHz "IF out" on the 930 so it cannot be done there without tapping into the IF signal inside the rig and bringing it out.

All you need is to plug an RCA Phono male to male cable into the IF out on the radio and the IF in on the BS-8 section of the SM-220. A shielded coaxial cable is recommended, but even a homemade twisted pair of wire cable works. You can probably get a cable at your nearest 99cent store or if worse comes to worse, Radio Shack.

The SM-220/BS-8 is a very versatile piece of equipment. You can use it as a standard O-scope, you can monitor your outgoing signal and check it for flat-topping, and with the BS-8, you can use it to "see" nearby signals with any of the above rigs, and in fact use it for any rig of any IF by tapping into the IF, buffering it and mixing it up or down to 8.83 MHz (or close to it).

# 1026. TS850 mic function

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-09 18:10:09 UTC
From: Adrian
Topic: 1026  Message: 1026

I'm probaly trying to get blood out of a stone, but is there any mod or hidden menu function, to enable the mic up-down buttons to control the radio similar to the m-ch rotary control ie in 5kc steps. Similar to how the ts50 will do that.At present in vfo mode the up down tunes similar to the tuning knob.Just wondered if 5kc stepping is possible in vfo mode?

cheers Adrian

# 1027. Is TS-850SAT mic audio available on ACC connector?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-09 22:07:14 UTC
From: w8nflists
Topic: 1027  Message: 1027

I can't find my manual - and I've only had the rig a month.

I have a wireless microphone setup, and want to connect it to the TS-850SAT. I was going to purchase another 8-pin connector for the front, but thought better of it. As many of those connectors as I've repaired for others, I realize it's not the sort of connector that you want to plug/unplug often. So I'd rather connect the wireless mic to the back of the rig - and use VOX. Is there a mic input on one of those ACC connectors?

tnx...W8NF

On the ACCY 2 connector, pin 11 is the mic audio input and pin 12 is
the audio ground.

# 1029. Transverter / satellite operation

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-10 13:41:44 UTC
From: vk6xhg0
Topic: 1029  Message: 1029

Anyone out there tried using there 850 as a satellite rcvr, ie 2401-145-28 mhz via a two mtr converter?
I would like to operate AO 40 , using a 2401-145 mhz downconverter then taking that down again to 28 mhz on the TS 850 sat.
I feel the excellent reciever in the 850 would be ideal for satellite reception. I dont want to re invent the wheel so I thought I would ask first.
Also anyone used the transverter side of the rig, any advice etc, and anyone tried to use the radio with software for tracking , ie doppler shift etc.
You have to ask or you dont learn cheers and 73 de Keith VK6XH

Have not tried this but should work. Keep your conversion gains low, as you will be generating a lot of system noise if you don't. b

# 1031. TS850s observations

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-10 19:51:25 UTC
From: Adrian
Topic: 1031  Message: 1031

Yesterday I had the 850s apart for some maintenance. Did the NB mod ie disconnect C618,C619 as per the the mod in the files sect here.The rit control and display had been erratic and not aligned at 12.00 oclock for zero.I lubricated the pot control with crc and it all came good, smooth control and re-zero was'nt a problem with internal adj.One thing i noticed is the alc tx problem when power supply was reduced to about 13.5v.Had a 5 second cycling of tx power with a cycling alc level seen on alc meter.At 14v the problem was gone and no problems.This radio is normally run at 15v and has a battery backup.Im thinking the dc-dc converter mod here I saw with R2 & R3 22Kohms resistance reduction to 18Kohms is a good fix in my situation.Im wondering how many people out there have replaced the dc-dc board when this mod probaly would have worked for them. Seems like a design issue.However if you get these symptoms try increasing power supply voltage towards 16v max and see if the problem dissapears. This radio runs nicely at 15v and the finals are very responsive to a small volt increase.One question I have is, what would stop the power level control-ie front panel control behind mike gain, from controlling power level,ie full power still at min setting.For some reason the alc voltage isnt being controlled by this control in this radio. Any idea's?

# 1032. Re: TS850s observations

Topic: 1031  Message: 1032

Carried out the mod to the dc-dc converter with absolute success and no alc oscillation at any voltage down to 9v tested. Used two 13Kohm smd resistors from a car stereo junker.Damn fiddly job,but worth it.In event of a power failure with battery backup only operation ie;12v this would have been a real problem to transmit.This dc-dc converter board is mounted on the same board with the nb mod etc under the speaker. Note the nb mod seems to make the alc problem worse for some reason, however the above R2,R3 procedure completely cured the problem.
currently doing the AT tuner in recieve mod, let you know how it goes.

Hi Adrian, When a TS-850S is "well" it will operate fairly reliably down to about 10.5 volts. Mine did, until the dc-dc converter started messing up. Mine's in a 11 pin socket so it's easy to change out (owner mod). b

# 1035. Re: TS850s observations DC-DC converter

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-12 14:27:12 UTC
From: Adrian
Topic: 1031  Message: 1035

Yes Bill, Well the way kenwood charge for parts over here, I took a more effective approach. I think my resistor change which cost me zero has a good permanent grip on the problem without it resurfacing again. I've heard of operators replacing the board with the problem re-appearing later on.
ie;A common ALC fault in the X59-1100-00 DC-DC converter board causes TX output power to cycle up and down in regular cycles due to alc voltage variation. This is dependent on the power supply voltage and will show up usually under 13.5v or less.
Instead of replacing the DC-DC converter board replace R2 and R3, 22kohm SMD resistors with a lesser value. I used 13kohm SMD resistors with great results ;ie no power dropoff symptoms down to 9v supply tested. have heard of 18Kohm values used with good results too.

cheers Adrian

# 1038. DC-DC Board Mod

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-15 20:53:58 UTC
From: Max
Topic: 1038  Message: 1038

I have recently performed the mod to the dc-dc board by changing R2 & R3 from 22k to 17.4k precision resistors. This mod solved my ALC oscillation problem completely and allowed me to achieve the higher output from the radio I was getting previously. At 14.5V DC the radio will produce 150W output when fed with a 1 khz tone. Before the mod maximum carrier power was barely 100W before oscillation started. Thanks to Adrian for all the valuable info with this mod.

Max

# 1040. TS-850 tuner squeek/squawk

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-20 02:22:01 UTC
From: k6htm
Topic: 1040  Message: 1040

This is an old topic but worth bringing up again. There are two teflon bearings/spacers inside the front of the tuner which rub against the case thus causing the squeek. You cannot get at them just by poking a lubricant straw through a hole, so you have to remove eight small screws on the front end of the tuner (two on each pot = four) and move the pots out of the way to get the juice where it has to go. I use Super Lube multi-purpose synthetic lubricant with teflon. Hoppe's gun oil is good too, better than WD-40 which I avoid because it gets gummy. Absolutely silent, like new! 73, Charlie - K6HTM

Hi Bill,

Sure, I'd love to send you a key.

Just so you know, the key doesn't do anything but show you as registered. I never crippled the software in anyway, as I originally wrote it for myself and I decided to share it one day.

The key allowed me to get some idea of the interest in the software, and still does. It amazes me that something I haven't done much work on, since 1995, is still being requested!

These days, I'm just way to busy, and my poor 850 sits lonely with no antenna, since I moved 4 years ago. I'll have to put something up this summer, so I can get back on the air. I do miss it...

Anyway, back to the key, I like to put a call sign and name on it. What would you like it to say? (I do a have a sense of humour, if you want something funny in there...)

Jim

One more thing.. It's funny, at the time I was concerned about Visual Basic taking up too much processing time... Can you imagine??? It's amazing the application doesn't think the rig has died waiting for a response, with today's machines!!!

# 1049. Where to obtain accy connectors?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-21 19:41:06 UTC
From: w8nflists
Topic: 1049  Message: 1049

I'm getting ready to cable up the '850 to other parts of the station. Looks like there are 3 accy connectors on the rear, all different. One's got 13 pins, one's a 5+1 DIN and one is something different entirely.

I can, of course, get the mating plugs from Kenwood, but has someone found that they're more readily available from, say, Digi-Key. I pretty much have to do all my ordering over the 'net, and making a phone call during the day to Kwood doesn't work too well.

TIA,

73,

Dave W8NF

I've found all of them at hamfests, including that weird 13-pin "ACC2" connector (the same connector is used on the TS-440). Maybe the next time I see them I will buy the guy out and offer them here. I remember they weren't very expensive, maybe 80 cents or a dollar each.

Topic: 1049  Message: 1054

Thanks Randy!

As hard as that 13 pin is to solder to, the MFJ cord might be better!

Bill

Subject: [TS-850_450_690] Where to obtain accy connectors?

I'm getting ready to cable up the '850 to other parts of the
station. Looks like there are 3 accy connectors on the rear, all
different. One's got 13 pins, one's a 5+1 DIN and one is something
different entirely.

I can, of course, get the mating plugs from Kenwood, but has someone

found that they're more readily available from, say, Digi-Key. I
pretty much have to do all my ordering over the 'net, and making a
phone call during the day to Kwood doesn't work too well.

TIA,

73,

Dave W8NF

I'm jealous. We don't get hamfests around here. Well, not within
4 hours' drive.

Dayton was hilarious this year. The flea market prices made
ebay look like a bargain!

Dave,

The 7 pin DIN cable for amp switching can use a standard 5 pin DIN
available from any Radio Shack. I have used one to successfully
switch a VHF transverter. The 13 pin DIN plugs are available from
www.packetradio.com BUXCOMM

For the 6 pin DIN (computer control) I just took another 5 pin as
before and carefully broke away all the plastic surrounding the
pins. I then soldered the PC control wires to them and heat shrinked
the connections. Place them in the socket according to the pinout
and wrap some tape around them. Mine haven't failed in over a year.

Hams are known for their ingenuity, aren't they?

73,
Max

Too bad about Dayton. You would think, given the apparent decrease in both attendance and retail prices, that the vendors would try to keep things low to keep people coming.

The computer control connector and pinout is also identical to that of the TS-440. I built my own control interface when I got my TS-440 and use the same box for the TS-850. I think I got the connector from Digi-Key but I'm not sure.

There are several "big" ones in Illinois each year. However, they seem to be declining in attendance.

That's too bad about the flea market prices at Dayton. I always look forward to the flea markets as a way to get something cheaply. If the prices do make eBay look like a bargain, that may be why the hamfest crowd is shrinking.

They're still great for eyeball QSO's, though.

I saw a TS-850 (no internal ATU) at the last one I went to for $500. It looked like a good deal.

Hi all,
I have a TS 850S/AT and I have a problem with the processor. When I press the PROC button , and then open the processor level I cannot hear nothing. So when I don't have the PROC button pressed the modulation will be good ( hear with the MONI) but when I press the PROC button , the modulation goes to zero, talk and hear nothing. Can someone help me about this ? please
Thanks de

Paul,

Is the transmitter showing any output power on the meter, or is it just an audio problem? Sounds to me like your processor board has taken a trip south!

Please advise.

On the IF unit, look at Z8, the proc unit. Check pin 3 "prs" signal, it should be 7-8 volts dc with the processor turned on. That is a start.

Please keep this thread intact when replying, I have a short memory and need to remember where we have been.

73,

bill

The AT mod proved very good here, using the G5RV aerial on 10M in a quiet location... really picks up the receive because of the inherent mismash between the G5 and the rig.

Yes works well, but I found with a pre-amp receive amp in line the effect is not noticable or worse than the thru position at a mismatched antenna frequency. With pre-amp off the effect is very noticable..

Topic: 1067  Message: 1068

Javier,
When I got my TS-690S recently, and I was shopping for filters, I also searched e-bay for the PS-53. There was a guy selling military spec Kenwood PS-53's - about 7 of them. I think. I did not bid on one, as I was on a budget, and I had a power supply. I don't think that he sold them all, so I just did a search on previously sold PS-53's, and I could not find the info. If I find it, I will let you know.

# 1069. Source for DIN connectors for Kenwoods.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-05-28 05:48:05 UTC
From: w8nflists
Topic: 1049  Message: 1069

Thanks to the folks on this great list, I confirmed the DIN-6, DIN-8 and DIN-13 connectors on the rear of the TS-850SAT are real.

It turns out that they are all standard DIN connectors, easy to get from many different places. Even the so-called "rare" DIN 13 turns out to be de rigeur on car stereos, particularly OEM, and lots of musical instrument accessories use it. Using Google to search for "DIN 13" and the others, I was able to scour for pricing and availability. My goal was to find a single source for a bunch of connectors that I needed, and I did find one - and it turns out they're less expensive than almost anybody else, too.

The RF Connection - www.therfc.com. Only $1.50 handling charge per order. Most of the DIN connectors are $1 each; the DIN-13 is $2.75. They also have the 8 pin mic connectors in stock. In addition to cabling the rig to remote accessories, I also like to have at least one spare of each external plug available in the event of a failure. So, will be placing an order from them for the TS-850 connectors and similar for my Icom.

73,

Dave W8NF

# 1071. Question on Noise Blanker Mod, and NB operation

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-02 16:21:58 UTC
From: Duncan Cameron
Topic: 1071  Message: 1071

I am contemplating the NB Mod, mentioned in the 850 notes (removing or cutting the traces on the two caps on the NB board), however I have heard mixed reviews of the results. If it would increase the effectiveness of the NB, I would go for it. Power line and atmospheric noise is my worst problem and it may be asking too much of the 850 noise blanker to deal with it. (As I understand it, it was not designed to do so) I am also looking for some information on the distortion that is common when using the noise blanker. Will removal of the caps elminate what sounds like "leading edge" distortion when NB#1 is employed?
I really enjoy the radio, but I usually want to find a way to "tweak it" and make it better.
Thanks!
Scott Cameron

# 1072. DSP-100

Yahoo group: TS-850_450_690 (2001 — 2005)

From: Rojas, Alberto R
Topic: 1072  Message: 1072

Hi Group, recently a good friend of mine, gave me a DSP-100, it
came without cables and manuals....

Does any know how to order or where may i find the schematics for wiring
of those cables.????

Noise blankers in their current configuration work only for impulse noise; static crashes and random band noise need a DSP unit to deal with.

The cap mod seems to work; have done for 2 people and they liked it. haven't tried on my own rig yet tho!

to get rid of line noise, put up loops. i have one for 20 that tunes all bands 20 and up. gets rid of tons of noise.

Thanks Bill,
I have been working on clearing brush and trees for a loop for 160 meters and up. I hope the trees I leave will keep the loop at a height of 45-55 feet. I will look forward to quiet bands and improved conditions.
It sounds like the simple incising of a couple of traces on the nb board will be a project for a rainy weekend. (after all they can easily be restored with an application of "Silver Trace")
Regards,
Scott C.

Use some desolder wick and suck both ends of the caps dry, then while heating one end gently torque them, just a little, with hemostats. They will pop loose and you can re-solder later if you want.

I just cut the trace in the small gap on the trace from each of two caps to next component which is close enough too solder direct in reversal of mod. However mod works great . The other day I had interference I normally have problems eliminating, and I hit the nb,s and completely gone !!! Magic

Topic: 1071  Message: 1080

Having just read the most recent round comments on the 850 NB modification, I am left with a question. Can someone explain what the net result of cutting or removing the traces on the two caps on the NB board is? Or stated another way, removal of these caps appears to dramatically improve the NB performance -- why does it improve the performance is my question? Is there any downside to this modification?

If this is such an easy way to improve the NB performance, I wonder why Kenwood didn't opt for the change years ago as perhaps part of a service bulletin -- or did they?. I am not skeptical of the modification, I just want to understand the inner workings of the radio better if someone can explain the modification.

As I understand it these caps eliminated are the only difference between this radio nb and the TS940 nb, which has a good reputation. The attack time window was cut short by the addition of these caps for reasons no-one knows. I can certainly vouch for the effect of the mod. In my opinion the nb was useless before in comparison.

cheers

# 1082. 850 NB mod

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-04 17:03:05 UTC
From: Eric
Topic: 1082  Message: 1082

As an owner of an 850, I have been taking an interest in the Noise Blanker modification that has been discussed on the group. I may have missed some information earlier on the subject, so I ask now if somebody could direct me to the source of how to perform the NB mod. I looked on 3w.mods.dk and did not see it. Thanks in advance.

Just FYI, I have compared my mobile rig, September 2002 Yaesu 100d, to the 850S and even though the 850S is 10-12 years old, it still has better receive than the 100d. I forgot which band I did the comparison on.

KB9IBT,
Eric

The NB board reference is X59-1100-00 and it is located directly under the radio speaker.
Remove the upper part of the cabinet and unplug the loud speaker. You will have to remove 4 screws and unplug 3 connectors in order to extract the board.
The picture uploaded to photo's here shows the board in its normal operating position.
The capacitors to isolate are C618 and C619. These capacitors are quite small SMD components and hard to locate if you don't have the service manual. In this manual, diagram and board view can be found in the RF unit section.

Alberto-I can find no reference to a Noise Blanker mod for the TS-450. I
don't have a manual to see if the circuits are the same between the 450 and
the 850.
Perhaps some other group member can answer your question.

Not surprised on the receive comparison, but then the 850 doesn't fit under the dash real well! ha...

anyway... I have done the mod on two other guy's rigs and they seem to like it. I involves removing two SMD caps from the small circuit board under the "s" meter area of the display. Or you can cut two traces...

I will post the mod to the group "files" area and also send copy to you (attachements to the group are disabled for security reasons).

As an owner of an 850, I have been taking an interest in the Noise Blanker modification that has been discussed on the group. I may have missed some information earlier on the subject, so I ask now if somebody could direct me to the source of how to perform the NB mod. I looked on 3w.mods.dk and did not see it. Thanks in advance.

Just FYI, I have compared my mobile rig, September 2002 Yaesu 100d, to the 850S and even though the 850S is 10-12 years old, it still has better receive than the 100d. I forgot which band I did the comparison on.

KB9IBT,
Eric

When uploading modifications to the group's "files" area, please use the MODIFICATIONS folder to keep things organized. Feel free to add appropriate folders as needed, just as you would on your own computer.

I have put the NOISE BLANKER mod in there, in two formats; use whichever one works for you.

73!

The 850 is much superior in many ways to the 50, but it's like comparing apples and oranges. I have used the ts-50 and the ts-850 and like them both, for different reasons.

No, I don't think so. You would be reverting back to 14.0000 Mhz each time you turned the rig off

Did you measure the voltage as I suggested?

# 1097. 450 mic problems.or audio.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-07 20:10:23 UTC
From: ve9buf
Topic: 1097  Message: 1097

Hello there to the group. THought i would join in to try on figure out my 450sat problem.
Now i have had this rig for a number of year, and do not operate that much, but lately got back to hamming as i have built an antenna this past winter and do have so time to myself, and figured i would get back to my hobby. Now this radio has never been modified in any way at all. Bought it and use it type thing. Now had noticed this a while back but never paid no never mind to it. Problem is that if my mc-60 mic is not turned on , that is the preamp, or whatever you want to call it, it will not get on the air at all, just garble and no alc reading or anything, in other words,, no audio. Now thinking that it was the mic, i borrowed a mc-80 from a friend, and there again the same thing,,, what is the matter ??? any idea ?? I am not a tech by any means, but if easy enough to fix will try anything. Dont sound right that the mic needs the preamp to put out audio.??

thanks in advance.
de Jean-Guy/ve9buf

# 1098. RE: [TS-850_450_690] 450 mic problems.or audio.

From: Rojas, Alberto R
Topic: 1097  Message: 1098

Hi buddy, MC-60A and MC-80 are preamp. mics, The take +8Volts from transceiver in PIN 5 . Gnd is pin 8

Check PIN 5 of Mic connector with a voltmeter, It should read 8Volts.

It the manual you can see PIN ID, or you can find it in counterclockwise way.

If 8 Volts is not present, probably 8 Volts regulator is down

Hello there, thanks for reply, did check the pin 5 voltage and came up with 7.57 volts only, wonder if that small amount would make the difference, to work or not work. Not as long as i can remember the mic never did work without the pre amp being on. Strange as it seems. again thanks, will see what others come up with .

Is the mic gain on the radio on at all?

Hello there to the group. THought i would join in to try on figure out my 450sat problem.
Now i have had this rig for a number of year, and do not operate that much, but lately got back to hamming as i have built an antenna this past winter and do have so time to myself, and figured i would get back to my hobby. Now this radio has never been modified in any way at all. Bought it and use it type thing. Now had noticed this a while back but never paid no never mind to it. Problem is that if my mc-60 mic is not turned on , that is the preamp, or whatever you want to call it, it will not get on the air at all, just garble and no alc reading or anything, in other words,, no audio. Now thinking that it was the mic, i borrowed a mc-80 from a friend, and there again the same thing,,, what is the matter ??? any idea ?? I am not a tech by any means, but if easy enough to fix will try anything. Dont sound right that the mic needs the preamp to put out audio.??

thanks in advance.

yes, mic gain is in at about 10 to 11 oclock, and still nothing , and if i bring it up more, all that will happen is just garble and not acl or meter reading of any sort. rather strange, trying to figure this out,, it should actually be the other around hi.
thanks for reply Sarge

You may be experiencing RF feedback. You have not really explained what you mean by "garble". If you have access to a dummy load try the same test into it. It will eliminate the RF feedback, if in fact that is what you mean by garble. I ran a 450 with the MC50 non-amplified mic and had no problems whatsoever. Try duplicating your tests into a dummy load and let us know what happens.

ok , will do just that today Max, found my heathkit dummy load, and will set things up today and do more testing. But strange that i would pick up RF in the non amplified mode of the mic, usually would be the other way around. But will try, thing today are not all logic hi.
Hope it works.
Thanks again.

Topic: 1097  Message: 1105

Hello again Max. well, did a bit of on the air testing with a friend, in order to find out what is going on. Now with the pre amp in,, well, i get out like a normal radio and good clean audio. If i do turn the pre amp off, then i have to raise the mic gain to ALC level, and all that is happening then, is simply not audio, or just a puut puut type pulsing . Rather strange indeed. It should actually be the opposite,, for if i was to be bother with RF feedback, you would think that the pre amp would really amplify the audio or really get in there.
Now this is with either the mc-60 or the mc-80 mics, they work the same way.
Also reading up about the 850 and a TNC connected to the ACC port do give distorted audio, so wonder that maybe this is applicable to the 450 also, BUt will try to unhook the tnc and find later on. Will advise.
cul.

# 1107. DC-DC Board resistors suggestions

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-09 15:11:14 UTC
From: Duncan Cameron
Topic: 1107  Message: 1107

I know, after reviewing the archives, that the recommended change on the DC-DC board is to reduce the values of R2 and R3 (both 22K SMD's) to anywhere from 13k to 18K ohms. The Kenwood part numbers for these resistors tells me that they are "thick film" (RK73) resistors. But I want the package size to match. I can't find any listings for the part number shown by Kenwood-RK73FB2A223J in any of my parts suppliers. I can find a RK73H, and the "2A" I believe would correspond to, for example a KOA size of 0805. (I suppose I could try and get a part from Kenwood parts that most closely matches what I want-like-RK73FB2A(and something close to 183)J, but I would prefer to get a part that is easily found. Any suggestions?
Scott C.

Thanks Bill, problem is that i dont have the hand mic, but will find one this week as a friend of mine has one, so will borrow just to try it.
Also another thing to try at this end , is to unplug the tnc which is connected to the acc 2 on the hf rig, did read up that there is some problems with certain tnc's and 850, so maybe same thing could also apply to 450, but will let the group know as soon as i do these test.
Many thanks to all.
Have a great week 73

The new 1/4W metal film resistors are about the size of the old 1/8W jobs... and you can find 1/8W resistors and just neatly bend the leads to fit, nice "L" shape, cut them short, pre-tin everything and solder them in carefully.

I was looking through my junque rigs for a "223" SMD resistor... very rare on the 2M radios! Everything seems to be 104, 105, 471, etc...

Yes, I think you are getting RFI on the aux audio port in back.
Best of luck! Using digital modes will test your RFI troubleshooting ability, and patience also!

Bill-
On the off chance that Kenwood actually had a part that would fit on the DC-DC board, I checked East Coast Transistor and they list an RK73FB2A183J (18K ohm chip resistor) This should be a direct replacement for the 22K ohm resistor on the board. They are 20cents apiece. Of course the shipping will be the major cost.
I may try your suggestion, unless I get a wild desire to drive to New York this weekend from Maine to save on the shipping.

FWIW,

I used 17.4K precision wirewound resistors. About the size of a 1/4 watt. Very touchy going in, but the mod worked great. Maximum output power is now back to normal.

I am thinking that there is no "bypass" path for the audio when the preamp is turned off... or, they are leaving the output stage of the mic amp connected to the audio line, which would be inviting trouble. if you have a skem of the mic that willhelp, I don't know where my MC-60 skem is, only about 35 folders to look thru in my file cab!

Anyone game to scan theirs and stick it in the "files" section?

Just a shot in the dark...does the MC 60 and 80 use voltage from the rig to power an electret element in non-amplified mode? And does the MC 60 and 80 run off internal batteries in amplified mode? The hand mic does not use this voltage. Perhaps the +8VDC is not present at the rig's mic connector.

My memory on the mics is a little fuzzy, so let me know if I'm off-base!

From: ve9buf
Topic: 1097  Message: 1121

Hello Paul, to answer your question, both mics do use voltage from the rig, + 8 volts pin 5, if i recall, and yes, the mics do run off the batteries in amplified mode. and yes, there is voltage on that pin like mentioned above. That voltage is always there on the rig connector, so when you plug in a mic, well,,,, and why wont it do its thing in the non amplified mode, they do get voltage to the mic, when the mic's pre amp is turned off. Of course the hand mic does not use pre amps, so guess if voltage is there or not, it dont bother it,, but why the other 2, ??
confusing for sure.
thank Paul, still hoping to come up with something.
I had mentioned before that maybe it was because of the tnc being connected to the hf rig,, well ,the hand mic works anyway with tnc still connected, so not gettting RFI from hand mic, that is if i get RFI, dont bother nothing else .

I have a TS-850 which works just fine. The back has a phono plug for connection to the Kenwood scope monitor. I attached a male phono plug and connected it thru a probe to a good working 100MHz oscilloscope but there was no viewable output. I tried all the amplification ranges on the scope but still nothing. Am I failing to do something?? How can I get an output to view on the scope?? Thanks for any advice. Steve AB9CZ

That output is a low level IF signal centered around 8.83 MHz. It is
for the SM-220 sation monitor with the BS-8 pan adapter. If you had
an SM-220/BS-8 or a spectrum analyzer and centered it at 8.83 MHz, you
would see a the received signals within about 200 kHz around your
tuned frequency. If your radio is not receiving any signals (no
antenna attached, or really dead band), you'll see nothing coming out
of the IF output. If you are tuned to a very strong signal, you'll
see an 8.83 MHz sine wave with perhaps more components mixed in if
there are other signals near your tuned frequency.

Other than that, a simple oscilloscope will not be of much use as a
spectrum monitor.

From: ac7nj@donobi.net
Topic: 1128  Message: 1128

There is a service bulletin ASB-1000
My problem is I don't understand all the technical implications of this modification?
Yes, I want to use a PK-232 for RTTY and PACTOR
BUT, I don't want to change the radio such that is will be a big task to use CW or VOICE also (or loose the ability all together)
Why can't I just reduce the audio out put of the TNC with series / parallel resistors in the cord to reduce the level to what is acceptable to the radio?
How did the audio become distorted on SSB Voice just with the cable connected to the ACC port and TNC?

Randy
AC7NJ

# 1129. Re: [TS-850_450_690] TNC help needed

The problem is RF pickup on the cable.

When getting on HF digital, it's always a challenge to get the RF in the shack under control.

Other than that, make sure that the IF output jack has not been
switched to use a transverter output as outlined on page 49 of the
operators manual. If this has been done (by a simple cable swap) you
will see no output from this jack under receive conditions.

Randy,

I run all the digital modes with my 850 using a program called MixW.
It will not do Pactor transmit though. I feed the audio lines
directly into the 13 pin DIN plug on the rear from my sound card. I
have the station grounded to the basement framing here in the shack,
and experience no feedback of any sort. No modification has been
done to the radio regarding digital modes, although I have done just
about every other mod!!
Max

Randy:

Be sure you are using separate power supplies for the TS-850 and the TNCs, shield all cables, etc, etc. Most TNCs and the TS-850 have all those lines by-passed for RF, but it may not be enough. If you want to get real serious, you could add one of these rig interfaces which has filtering/chokes on all the leads.

One sure way around the problem is to use the TS-850 in FSK mode rather than AFSK - The PK-232 will work in FSK (RTTY) mode and you'll be fsking the TS-850 rather than sending audio tones to the modulator in SSB mode. You will also be able to benefit from the 500Hz CW filter if you have one. That might not solve the problem of RF pick up in voice SSB while the TNC-to-Radio cable is attached, but you won't have an TX audio problems during digital operations. And you won't have to modify your radio.

I have used a KAM and SCS PTC-II with the TS-850 in LSB and USB AFSK w/o any problems- I've had a bunch of PK-232s in the past and can't imagine I didn't use one on the 850.. but might have been using FSK - I've done that with KAMs also.

If you must use AFSK - set the PWR control full clockwise, and put the mic gain control where you use it on SSB with a microphone. (Mine is about 2-3). Then in with your terminal program in RTTY or AMTOR FEC mode, adjust the TXA output from the PK232 until the ALC on the RADIO just barely indicates a single LED. If you have 50w or more - that is where you should leave things. If you have more than 50w - leave the TXA level where it is and reduce the power with the mic gain control to less than 75w when running digital.

If you have severe ALC action with less than 30w output, you may have a problem with the DC/DC converter we've all experienced... but you should notice that on voice as well.

Subject: TNC help needed

There is a service bulletin ASB-1000
My problem is I don't understand all the technical implications of this modification?

Yes, I want to use a PK-232 for RTTY and PACTOR
BUT, I don't want to change the radio such that is will be a big
task to use CW or VOICE also (or loose the ability all together)
Why can't I just reduce the audio out put of the TNC with series /
parallel resistors in the cord to reduce the level to what is
acceptable to the radio?
How did the audio become distorted on SSB Voice just with the cable
connected to the ACC port and TNC?

Randy

Topic: 1132  Message: 1133

Thank you, Bud I'll put the TNC on a different power source and try
that.

FSK mode option is interesting but I don't know how to configure
that.

If you could help me with that off list I would appreciate it very
much this is somewhat off topic for the list.

Randy:

Be sure you are using separate power supplies for the TS-850 and the
TNCs,
shield all cables, etc, etc. Most TNCs and the TS-850 have all those
lines
by-passed for RF, but it may not be enough. If you want to get real
serious, you could add one of these rig interfaces which has
filtering/chokes on all the leads.

One sure way around the problem is to use the TS-850 in FSK mode
rather than
AFSK - The PK-232 will work in FSK (RTTY) mode and you'll be fsking
the
TS-850 rather than sending audio tones to the modulator in SSB mode.
You
will also be able to benefit from the 500Hz CW filter if you have
one. That
might not solve the problem of RF pick up in voice SSB while the
TNC-to-Radio cable is attached, but you won't have an TX audio
problems
during digital operations. And you won't have to modify your radio.

I have used a KAM and SCS PTC-II with the TS-850 in LSB and USB AFSK w/o any
problems- I've had a bunch of PK-232s in the past and can't imagine I didn't
use one on the 850.. but might have been using FSK - I've done that with
KAMs also.

If you must use AFSK - set the PWR control full clockwise, and put the mic
gain control where you use it on SSB with a microphone. (Mine is about 2-3).
Then in with your terminal program in RTTY or AMTOR FEC mode, adjust the TXA
output from the PK232 until the ALC on the RADIO just barely indicates a
single LED. If you have 50w or more - that is where you should leave things.
If you have more than 50w - leave the TXA level where it is and reduce the
power with the mic gain control to less than 75w when running digital.

If you have severe ALC action with less than 30w output, you may have a
problem with the DC/DC converter we've all experienced... but you should
notice that on voice as well.

Hi Sarge,

go to http://mods.dk/

and click on kenwood, then scroll down right side of page to the ts-450. there are a few things to read about it.

If you need more, contact me. The diode you need to remove is on the opp. side of the control unit, facing the chassis so you will need a number one philips head screwing driver and some patience.

73!

# 1139. TS-850S CAR Board (X50-3140-00) IC's

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-28 00:34:36 UTC
From: Bill Smith
Topic: 1139  Message: 1139

Having read about all the DDS IC failures on the CAR board I decided to go ahed and buy some parts whaile they are still available. I have heard through the grapevine that the old chips(part number YM6331) have been replaced with a new and improved IC (part number YM66312).

I thought I would just buy a complete board since I can't see well enough anymore to desolder and replace surface mount IC's. Since no one at Kenwood parts can verify whether or not there ever was a new and improved DDS IC why buy a new board with old IC's on it? I have heard that the replacement DDS chips were the new style (part number YM66312).

Anyone heard about this before?
Thanks,
Bill Smith KO4NR

# 1140. Re: TS-850S CAR Board (X50-3140-00) IC's

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-29 13:13:25 UTC
From: ko4nrbs
Topic: 1139  Message: 1140

Tom Alldread (VA7TA) bought a new CAR board for his TS-850s about 5 years ago from Kenwood Canada and the DDS ICs on it had the part number YM-66312 on them. This confirms that Kenwood does have a newer version of the DDS chips. I can't say they are redesigned or modified but with the addition of the "2" on the part number it does appear that the chips are different.

I am trying to get Kenwood to explain this and will post what I find out.

I do intend to buy a new CAR board but will not buy one if the DDS chips on it have the old part number on them. I'll buy DDS chips if I have to to get the newer type with the part number YM-66312 on them.

73,
Bill

From: Bill Smith
Topic: 1141  Message: 1141

I found this article on how to make a hot air
desoldering tool for surface mount IC's on the web.
May try it for the DDS chips on the 850S CAR board.

http://www.usbmicro.com/odn/documents/46.html

# 1142. Does a complete TS-850SAT service manual exist online

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-30 03:04:39 UTC
From: Dave W8NF
Topic: 1142  Message: 1142

I am aware of the TK5EP and www.mods.dk service manual downloads - they only go up to page 115.

I ran the 40 meter station this weekend for FD. A TS-830S from the club's inventory had been picked out, and I'd done a needed cleaning of the front panel pots and switches. But as luck would have it, the pre-cut club antennas were tuned a tad low. The internal pi network handled it OK, but because it was reactive, we had to re-tune the rig when we QSY'd even a little bit. From flat land, 40 meters is a purely S&P band from California on FD. So we had to do a lot of QSYing.

I'd brought both my IC-735 Icom and my TS-850SAT, hoping to not use either one. But the frustrations of re-tuning the 830 drove me to put the '850 on the station. It has the built-in tuner, so this should fix the QSY problem. Things were OK, other than the irritating stink - there was a mid-sized dog roaming the site, and it sure smelled as if his eyes had gone bad and he'd mistaken our tent for a fire hydrant. And it got stronger. Ugh.

Maybe 3 hours after the '850 went online, we suddenly were getting ZERO QSOs. Quick check, and the power output was zero. Yuck. I don't relish working on the '850, but maybe it's not as challenging in there as I fear.

Anyway, the old Icom 735 went on the desk and proceeded to run for 16 hours without a hitch, and we didn't even bother to tune out the 5:1 VSWR - just ran the rig right into it. Must have been working OK, I ran about 190 CW QSOs the last two hours of the event. A 40 meter Yagi at 50 feet was helpful.

The "doggy" smell is definitely coming from the '850. Now that I know it's electronic in nature, it actually smells like bad electrolytic capacitor. I pulled the covers off and so nothing discolored, but the soldering and heatsink compound work on the PA unit looks horrible. Either Kenwood didn't pay much attention to assembly when they built this one, or it's been "repaired" by someone who didn't know what he was doing.

So, about now, I think I'd like a complete copy of the
manual. Is Kenwood the only place?

Sounds like the exact same problem I had a year or so back

C1 On the car board has went and needs replace if you are luck that's all
but on mine the trx board had a failed component as well

if you want I have a pdf of the tech manual its a good size can give you
access to my ftp if you want
or I can give you a quick locator of the boards via e-mail

Mine let go some of the first times I used the MC-60 microphone and was in the adjusting phase, maybe too much drive?

I have the service manual, but in the real world--not electronic.

Eric

# 1146. Re: Does a complete TS-850SAT service manual exist online

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-30 18:25:31 UTC
From: w8nflists
Topic: 1142  Message: 1146

By "the adjusting phase", do you mean while the auto tuner was
operating? I thought that power was limited to 10 watts.

We were definitely pushing the rig, with mild compression and the ALC
meter reading upscale about halfway. There was audible distortion,
but we were still cleaner than most signals on Field Day. Still, a
rig shouldn't allow you to drive it to the damage point - that's the
first function of ALC, to prevent damage from overdrive.

Responses from others suggest that it was an electrolytic on the CAR
board, so I'll check into that.

What blew on yours? Was it actually the finals?

Thanks!

73, W8NF

# 1147. Re: TS-850S CAR Board (X50-3140-00) IC's

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-30 18:28:06 UTC
From: w8nflists
Topic: 1139  Message: 1147

Sometimes a chip manufacturer makes a change in the process used to make the chip, without changing the design of the chip. This happens most frequently when a semiconductor process goes obsolete. Most of the time, a chip with an added numeral after the main designator is intended to be identical to the one it replaces, but they must make a change to the part number to alert designers/manufacturers that in some corner cases it might behave differently.

I believe it was a capacitor, burned pretty good. A fellow ham knows a good tech and that is who performed the repair. The description of location has been lost in my brain, but the tech followed the smell to its location. In my case I believe the mc 60 was pushing the alc too hard before I adjusted the mic., etc.

Eric

# 1151. Power button cap

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-06-30 23:09:44 UTC
From: Dave
Topic: 1151  Message: 1151

Hello group!

I recently got a TS-450 at a hamfest. This is my first
HF rig and so far it seems great. (I gotta get my antenna
out of my house!) Anyway, the only thing that I can find
wrong is the cap for the power switch is missing. The switch
works fine, it's just a pain to push in. Before I kludge
something together, I wondered if anyone knew where to get a
replacement cap for a reasonable price.

Thanks,
Dave

Write this on your owner's manual:
k29-0758-14 (ts-440)
or
k29-4636-05 (ts-850 etc)

They are nearly indistiguishable, I use either one for
either one without complaint.

I have one of the 0758 if you want it; $5.00 with
shipping if you want it, or if you need more stuff you
can call PacCoast parts. Let me know.

73,

# 1153. TS-850S CAR Board DDS Chip Date Codes

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-01 23:06:29 UTC
From: ko4nrbs
Topic: 1153  Message: 1153

Has anyone kept track of the date code on the DDS chips that have failed (Part Number YM6631)?

The date code on mine are 9028. So far no problems.

73,
Bill

Alberto -- I scanned the Instruction Manual and
schematic (very large) and emailed them to you. The
part numbers for the cables are listed in the manual.
You can probably order them from Pacific Coast Parts.
The black and yellow cables are ordinary audio cable
with RCA plugs. The six and thirteen pin cables you
might want to order. www.pacparts.com 73, Charlie

Alberto -- I scanned the Instruction Manual and
schematic (very large) and emailed them to you. The
part numbers for the cables are listed in the manual.
You can probably order them from Pacific Coast Parts.
The black and yellow cables are ordinary audio cable
with RCA plugs. The six and thirteen pin cables you
might want to order. www.pacparts.com 73, Charlie

Thanks, Max!

I made my first QSO on 60 meters yesterday with the TS-850. Should be interesting to observe propagation on that band.

# 1163. TS-690S FOR SALE

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-04 21:59:43 UTC
From: n7ioh
Topic: 1163  Message: 1163

I have for sale, TS-690S with optional AT-450 automatic antenna tuner installed. The radio covers all Amateur bands from 160 Meters to 6 Meters and has had the MARS/CAP modification done. This radio is really just like new, a 10 all the way. The eHam reviews rate this radio a 4.7 out of 5. There is not one scratch or mark on the radio. Radio works great and has the following options and accessories. New spare Lithium battery, TU-8 CTCSS tone unit, Kenwood Service Manual, original owner's manual, two INRAD 2.1 SSB filters (cost me $241), original mic, and the MB-430 mobile bracket. I have never used the optional AT-450 automatic antenna tuner. Bought the tuner before they became obsolete and just installed it about 1 year ago. I don't think I even cut the internal wire needed for it to operate. I use only ladder line with a Heathkit SA-2060 tuner. The radio has never been mobile, bought the bracket off eHam about 4 months ago but I have never used it. I have all the original boxes. I am single and a non-smoker so the radio has not been around smoke or kids at all. I had the Yaesu FT-102 and now operate the JRC JST-245. This radio has always been my backup radio so it has really seen only limited use. I am the original owner and I have always kept it covered up when not needed. Asking $850.00 for this radio that is absolutely mint. Please contact me by e-mail.

Al N7IOH

# 1164. DDS - meaning and function

From: Zack Widup
Topic: 1164  Message: 1165

Most likely it refers to "direct digital synthesis" - instead of
phase-locking an oscillator to some portions of a reference crystal
oscillator, voltage values of portions of a sine wave (or other wave)
are fed to a D/A converter and a waveform is directly synthesized.

Direct Digital Synthesis.

It's a way of generating signals without using VFOs (too drifty) or PLL/VCO/DIVIDER schemes (too noisy, not enough resolution for smooth tuning).

All the newer rigs have at least one DDS source in them, usually for the VFO function.

Some rigs don't have them for cost reasons, or because DDS was not developed for radio when the radio was designed or they were too expensive to put in.

DDS is basically just a ROM (Read Only Memory) that outputs data as it's sequential addresses are read by a serial or parallel data stream; this output data is in parallel form, from 16 to I believe a max of 32 bits. This parallel "word" then goes to a "digital to analog converter" which is nothing more than a resistor network and filter, that converts the output of the ROM to a waveform of some sort. Most often in radio the waveform is a "sine" wave, but it can be any waveform at all. DDS finds applications in cell telephony, music, high-end audiophile devices, all sorts of things.

The same chip used in your ham radio may also be used in a medical device, lab signal generator or the keyboard at church.

73,

Bill

Unless your rig is a TS850. Kenwood had their own dual
DDS chips made, the famous YM6331. It seemed they didn't
get the first ones quite right and most of them are either
dead now, or dying fast. They will charge you $28 each to
pay for their mistake (times four).

# 1171. Problems with TS850SAT

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-08 17:08:38 UTC
From: Mario Aviles
Topic: 1171  Message: 1171

Hi:

I am a new member, just approved by Bill. Glad to meet all of you.

I need your help in solving a problem. Yesterday as I was listening on my TS850SAT, suddenly the whole display turned off but I could still listen and transmit. I checked some of the other functions like the automatic antenna tuner and it worked fine. Apparently the display is the only problem.

Has anyone heard of a similar problem and can help me solve it.?

Best regards, 73 and DX

Mario /YS1MAE

From: Bill
Topic: 1171  Message: 1172

Mario, there is a DC-DC converter in the front panel
unit that generates the voltages needed for the
fluorescent display. I would suggest checking for
loss of 12v to this converter, or bad solderjoints
around it.

Will check into this more when I get to the shop.

# 1173. Possible DDS failure, TS-450

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-08 21:37:16 UTC
From: Dennis, low budget dxer from the Philipp
Topic: 1173  Message: 1173

July 9, 2003

Thanks Zack & Bill for the insight on the meaning and function of DDS.

The reason I asked is :

I know a friend living south of my island whose TS450 has been seating in the repair bench for more than 2 years now. The technician working on it don't have the service manual and this is how he had roughly describe the trouble of the rig :

The radio is more or less dead. He had manage to trace the problem on the Carrier Unit Board X50-3160-00. According to him there is no 455 kHz outout at Local Oscillator #4. Using a signal generator, the radio works fine. He believes that ic labeled on the schematic as CP3 & CP4 (D/A converters) are the culprit. I believe otherwise. Using the Service Manual of TS-850 which I have on file, those 2 IC's are connected to the big IC1 YM6631 which is the DDS chip. And from all the postings I have compiled, the DDS chip seems to be the culprit of this problem. Am I right to say that the DDS chip YM6631 is infact the problem not CP3 & CP4? Where can I order this part? Is there any "generic" replacement for this ic? (I doubt about the DDS chip but maybe the D/A converters CP3 & CP4 have).

I need comments on this one so I can confirm with them that it is the DDS chip not the D/A converters.

Many thanks in advance.

Dennis Ls. M. Cruz

P.S.

There is another guy in my island who also has a TS-450 with a different problem. I shall outline it later once we fix the above rig.

# 1174. Power supply question

Just acquired a new, non-Kenwood, power supply. The manual for the TS-850 gives a voltage input range of 12-16 volts with 13.8V nominal.This power supply has a no load, and non adjustable output, of 16.32V.Drops to 15.85V with the 850 in rx, 13.7V at 100w cw.I'm a bit uncomfortable with the, borderline high, voltage supplied by this unit.Does any one have an opinion , or knowledge, as to the advisability of continuing the use of this ppower supply?

Al,
I have both a homebrew 25A and a Kenwood PS52 supply I used on my
850. I ran them at 14V output. I would go as high as 14.5 but I
would be a little leary around 16V. Can you turn it down internally?

Max

Unfortunately there is no provision, internally or externally, to adjust the output of this particular supply. Was made for a commercial rig that has a wider input voltage range than most ham gear.I'm inclined to not use this unit for my 850, since I don't know if it's safe, long term.I don't want to zap anything in the 850.

I am leery of the voltage drop; indicates poor or no
regulation. Heck, may as well use a car battery.

What brand is it?

Did you measure the voltage at the rig end of the power cord? The cord
might be so long as to drop enough voltage to make you feel better...
But I would also advise you not to use it. The regulation is not too good,
either.

Another slant on this problem is to make the PSU "better" until you
get a replacement. How about putting a couple of high current diodes
in series with the power lead. This will drop approximately 1.2v at
all times, therefore dropping the no-load voltage to about 15v and the
CW TX load to about 12v. This is probably acceptable under most
circumstances as it is well below the recommended maximum for the 850
and still decent at full load. Regulation is terrible as already mentioned, just like
that of a car-battery without the engine running; the voltages shown above
aren't far different from a car battery in reality. Make sure the diodes are fully
capable of 30-50A to be on the safe side. A power bridge rectifier should cost
no more than $5 for this. Wire the PSU +ve to the bridge -ve and the power lead
+ve to the bridge +ve for a nice 50A 1.2v dropper. Completely ignore the AC pins.
(Draw a bridge if you didn't follow that!)

Personally I would still say "Get another PSU" but in the mean time this
one should be safe enough to use given a bit of thought. It's not the best
option but certainly one I would use given an urgent need. Just watch the TX is
clean and not chirping at heavy load.

Any opinions folks?

Bill,
I was not going to mention the brand , but, since you asked, it's an
SGC PS-30.Rated for 30-40 A.Made for the SG2000 commercial/marine
rig.Very solidly built, but It's performance is not what I expected.

Wow that is wierd... SGC known for high quality stuff.
Guess their marine rig not too fussy.

The 850 would be ok at the higher voltage, but with
lack of regulation I worry about the ac line going
high on ya.

I'd recommend one of two things - either get another power supply or put in a bunch of pass transistors to regulate it to 13 volts or so. The trouble with the pass transistors is they throw away so much power as heat.

only if you run RTTY or FM...

Astron runs 22v unreg, 14 out, diff is 8 volts, rig
draws 2 amps on RX so that's 16 watts wasted in RX,
slightly more, say 5 amps average on ssb, so that's 40
watts on TX.. not too bad.

Switcher's way more efficient, but when they break I
can't fix 'em.

Al, I have been looking for a new power supply and was considering a switching supply until I read the ARRL reviews in January 2000 QST. It looks like they all exhibit broadband noise that can be picked up by your radio. This is more true of some then of others. The best one they tested in my opinion was the Astron SS-30M. It seemed to have the least amount of noise and only below about 7 or 8 MHz or out of the Amateur bands. I like the lower bands so I guess I won't be buying a switching power supply. Right now I have the Astron RS-70M but want a smaller one that I can take with me that doesn't weigh quits so much, 46 lbs. I am now looking at the Astron RS-35M, weight is about 25 lbs. I like the Astron linear power supplies, very rugged units. There is only one thing that I have heard that they need to have done to them. They need to have a fast blow fuse of the same amperage as the supply added between the positive lead from the filter caps and the over-voltage SCR circuit. Evidently the SCR's can't take the surge from the caps in a failure and it causes extensive damage when it goes. Just thought I would relate this information for whoever might be interested.

I can't say that I have done a scientific study, but in about a year of use I have not noticed any noise that could be traced to my SS-30M. I operate mostly 40 meters.

Thanks to all who replied to my original question.I think my best course of action is to accept the fact that I made another expensive mistake in the purchase of the SGC supply and return it for exchange to AES.I did expect better performance, but the SG2000 specification says 11.5-18V power input,so, for an SG2000, it's an acceptable unit. But for other ham gear it's probably not a good idea to use one.
Thanks all,
AL

Hi Group.

My rig is a TS850Sat and have 3 questions. I would like to build myself a 232 interface for computer control of the radio. I've seen several diagrams, one which uses only a resistor and diode and others using de MAX232 chip. Any suggestions or recommendations? Also, I noticed that the Rig control connector is shared by the DSP100. How do I connect the interface with the DSP100 using the socket? Any conflicts? And finally, I have a SM220 scope without the pan adapter. Is there a circuit available to turn the SM220 into a pan display for the 850?

Thanks very much

Mario

You can't go wrong with the MAX232 chip. I'd recommend that. That's what
I use.

I'm not sure about the other two questions.

Use the MAX232A chip. Very easy to build. In fact I have one for sale if anyone is interested.

Also, I noticed that the Rig control connector is shared by the DSP100. How do I connect the interface with the DSP100 using the socket? Any conflicts?

Never had a DSP100, up here in Canada they sell for the price of a small family sedan!

And finally, I have a SM220 scope without the pan adapter. Is there a circuit available to turn the SM220 into a pan display for the 850?

You want the BS8 pan adapter. I see the SM220's selling on eBay all the time BS8, and occasionally you see the adapter separate.

Sad to say, but I am no longer the owner of my coveted TS850. I have traded it for another HF rig which shall remain nameless, but I will tell you it starts with a Y**** and has the number FT920 on it! Still playing around but enjoying it. Of course if the budget allows I wouldn't hesitate to grab another 850.

Max,

Regarding trading in your TS-850SAT for the
Yitriumzonix (I assume that's what Y**** meant ;)
FT-920, enquiring minds want to know?

What drove you to making the decision to trade in the
'850? Were you able to cash out a bit, or was there
some feature on the Yitriumzonix rig that you really,
really wanted?

Those of us who never get to visit a ham store depend
on individual amateurs' comparisons of one rig to
another, so I'm all ears. Well, OK, maybe not ALL
ears. Lately, the belly part of me is starting to
dominate more than I would like....

# 1191. Switching power supplies

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-13 07:13:59 UTC
From: Dave W8NF
Topic: 1191  Message: 1191

For years, there was skepticism in ham circles that switch-mode power supplies (SMPS) belonged in ham radio. Today there are lots of them.

I have had a couple, and been disappointed. But then, I like 160 meters. Typically, when I try an SMPS, I hear carriers on 160 meters at S9 to S9+20dB, depending on the power supply. They are frequency-unstable, and sometimes have a bit of bandwidth, and sometimes are more pure. The spacing depends, of course, on the SMPS' switching frequency. The spurs are also loud on 80 meters. On 40 meters, sometimes I hear them and sometimes not.

A buddy of mine bought an SMPS from Radio Shack and told me it's very quiet. No noise. We looked at the output on an oscilloscope and it was no better than my SMPS. This did not make sense. This buddy also is a 160 meter enthusiast - in fact he does weaker signal work than I do, so his station should be MORE sensitive to noise.

So I borrowed his SMPS. I heard lots of noise. What??? So I lent him my "noisy" SMPS. On his station, he could not hear the noise of my power supply, that to me was too noisy. So I gave him my radio!!! He and I (at the time) both used Icom IC-735s, so I was quite puzzled why his IC-735 did not hear the same noise mine did.

His report was quite strange. HIS Icom IC-735 on his antenna, did not hear either power supply. My IC-735 on his antenna, also did not hear either power supply. However, either 735, connected to NO antenna, heard BOTH supplies, just as loudly as my IC-735 heard both supplies in my shack.

I then bought my TS-850SAT, figuring that there was something really goofy about the Icom IC-735, maybe it had poor power supply rejection filtering. Nope. My Kenwood TS-850SAT heard the power supply just as strongly as the IC-735 did - in my station. Over at his station, the TS-850 could still hear the supply but not as strongly as at my station.

I gave up and bought a linear Astron supply.

So, whether a given switching power supply will be "too noisy" for your installation is - well - not a gamble probably, but it is clear that I have not figured out how to predict how quiet a power supply needs to be in my situation!

I got to use a TS-2000 on Field Day. It was the AO-40 rig. I really didn't like it. I still don't like the menu-driven radios. It took the OWNER 5 minutes to figure out how to get it to work on CW and he never did figure out how to get the sidetone turned on. And he's had the rig for a year.

The only feature I liked about the radio was the "tracking split" feature. This would only be useful on satellites. The transmit frequency changes by the same amount the receive frequency changes when you tune around, so you will (hopefully) be transmitting on the appropriate uplink frequency to net with the station you're calling or working.

I'm sticking with the 850 for now. I haven't seen a better receiver; there may be a couple equals but they didn't seem better than the 850.

Dave, out of curiosity, have you put the Astron linear power supply on the scope to see how it compares? Also which Astron supply did you get? I have the RS-70M and I am considering buying the smaller RS-35M.

Subject: [TS-850_450_690] Switching power supplies

For years, there was skepticism in ham circles that switch-mode power supplies (SMPS) belonged in ham radio. Today there are lots of them.

I have had a couple, and been disappointed. But then, I like 160 meters. Typically, when I try an SMPS, I hear carriers on 160 meters at S9 to S9+20dB, depending on the power supply. They are frequency-unstable, and sometimes have a bit of bandwidth, and sometimes are more pure. The spacing depends, of course, on the SMPS' switching frequency. The spurs are also loud on 80 meters. On 40 meters, sometimes I hear them and sometimes not.

A buddy of mine bought an SMPS from Radio Shack and told me it's very quiet. No noise. We looked at the output on an oscilloscope and it was no better than my SMPS. This did not make sense. This buddy also is a 160 meter enthusiast - in fact he does weaker signal work than I do, so his station should be MORE sensitive to noise.

So I borrowed his SMPS. I heard lots of noise. What??? So I lent him my "noisy" SMPS. On his station, he could not hear the noise of my power supply, that to me was too noisy. So I gave him my radio!!! He and I (at the time) both used Icom IC-735s, so I was quite puzzled why his IC-735 did not hear the same noise mine did.

His report was quite strange. HIS Icom IC-735 on his antenna, did not hear either power supply. My IC-735 on his antenna, also did not hear either power supply. However, either 735, connected to NO antenna, heard BOTH supplies, just as loudly as my IC-735 heard both

supplies in my shack.

I then bought my TS-850SAT, figuring that there was something really goofy about the Icom IC-735, maybe it had poor power supply rejection filtering. Nope. My Kenwood TS-850SAT heard the power supply just as strongly as the IC-735 did - in my station. Over at his station, the TS-850 could still hear the supply but not as strongly as at my station.

I gave up and bought a linear Astron supply.

So, whether a given switching power supply will be "too noisy" for your installation is - well - not a gamble probably, but it is clear that I have not figured out how to predict how quiet a power supply needs to be in my situation!

Dave,

I guess I was just itching to try something new. The 850 worked very well, but I was interested in 6m. I'll admit the 920 doesn't sound as nice as the 850, but the receiver is pretty good. Clear easy copy on signals that don't even register on the s-meter. Interfaced very easily with my PC for digital work, have the FM board coming, still need an AM filter. The thing I miss most about the 850 is the filter selection in any mode. But who knows, I may pick up another 850 if the price is right.

Some of us are sorely tempted by the flashy DSP rigs that have been introduced since the 850 came out, myself included. So far I have been able to resist the temptation! My logical side says "They don't make 'em like they used to," as I remember the tremendous receiver and transmit/receive audio on the 850. In QST reviews, the blocking dynamic range numbers of the 850 are only beginning to be approached by the new DSP radios.
However, we are not always logical! Right now I feel that the only reason I would get rid of the 850 is for the convenience of HF/VHF/and maybe UHF in the same rig. And then, I hear one of those whizz-bang rigs on the air...with a broadcast mic, equalizer, compressor hooked to it...still not sounding as good as an 850.
And again, for a while, I am content...
73,
Paul K4PDM

I just don't like the rubber keys. Never have. Put
up with 'em on the HTs but not on the HF rigs... Give
me hard plastic or metal.

It takes a little training with these rigs to run
modes other than what you are used to. I even carry
a copy of the menu commands for the 850 in a plastic
slip sheet in the Field Day packet.

My second field day started off with a training
meeting the month before, where we actually ran thru
some simulated QSOs so the older ops could show us how
to not waste time, dupe correctly, etc.. using code
oscillators... It was quite fun and 3 hours had gone
by before we knew it. A week before we took our rigs
over to a guy's house and hooked them up and
cross-trained on them. Paid off, as we would switch
off operators and didn't have to ask questions about
how to tune the rigs etc.. and there were no damaged
rigs that year!

The Astrons typically run less than 5 mv p-p of noise
on their outputs; slightly more with load.

Something about the grass and the fence comes to
mind.. hmmmm

The 850 sounds awesome with a vhf converter, even a
cheap converters sound good on the 850.

Check out Down East Microwave's products:
http://www.downeastmicrowave.com

Steve also has an interface especially designed for the TS-850 for transverter interfacing so you don't have to modify the radio and can still use it on HF when you're not on the transverter. It's the TIB850. You can buy it assembled, in kit form, or just the PC board.

TS850's are great rigs for use on VHF+ with transverters. There have been a couple articles on modifying them for a single band but they usually involve taking the finals out of the rig and putting the transverter in place of the finals. Someone about a year ago was selling three single-band 850's for 50, 144 and 432 MHz at about $650 each. If you don't mind having the transverter outside the rig, the DEM interface is the way to go.

I don't have any connection with DEM except for being a very satisfied customer for over 10 years.

I really like the Ten Tec 99.00 unit, it's a kit and
works real well. I wired one up to a TS-530 for a
guy, used the SG switch on the back to bias the
screens for QRP and to drive the converter; worked
like a champ. He made his first 6M qso (co-tx) while
rig was still in the shop with the covers off, as I
was showing him how to operate that get-up! hi

Al,

I got the Astron RS-35M - with meters. If you want to accurately measure volts & amps, don't bother with the meters. The way they're wired into the circuit makes them not very accurate, plus they're low-grade meters with lots of viscous friction. On the other hand, if you're like me and you just wanted a visual indication that the power supply is alive and the rig is drawing about the right current, then the meters are reasonable.

My 'scope shows about 8mV peak-to-peak of total NOISE on the RS-35M. And that is critical. Broadband white noise does not cause audible birdies in a receiver. The spectrum of this noise extends out to about 20 MHz, but once you feed it through your rig's IF filter, there is so little total energy left that it is swamped by atmospherics. The problem with switchmode supplies isn't the total switchmode noise level, the problem is that it is concentrated into a carrier with harmonics, which is very audible.

At 30 amps current from the Astron, I measure about 50mV peak-to-peak ripple, and most of it is at 120Hz. Of course, that sort of current draw happens when you transmit. I can not see any effect on the carrier of my TS-850 or my IC-735 under these conditions.

As far as my rigs tell me, the RS-35M is completely silent. What little noise it delivers is inaudible in receive and has no effect on transmit.

Dave, out of curiosity, have you put the Astron linear power supply
on the scope to see how it compares? Also which Astron supply did you
get? I have the RS-70M and I am considering buying

the smaller RS-35M.

The ASTRON meters are almost always set low, by 10-20 percent.

I set the astron to exactly 15 volts; then I use the DVM to set the voltmeter and a huge 15 ohm ww resistor to set the ammeter to 10amps (usually it starts out reading 7-8 amps!) Then I connect the second load resistor and make sure the 20A reading is OK, and trim as needed.

This also load-tests the supply somewhat so you will see if there is a problem before you get the cover on the supply.

When Astron comes out with a good digital metering system on the PS I will get another one.

# 1204. TS-850 and VHF/UHF converters

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-15 20:37:13 UTC
From: Dave W8NF
Topic: 1204  Message: 1204

I think the TS-850 has a dedicated jack on the rear
for driving a converter.

Elecraft just came out with VHF/UHF transverters.
They look like the K2, but they are intended to
operate with any HF rig.

I have met the K2 guys Eric and Wayne, and I have
studied the K2 radio. It is an impressive bit of
engineering, and the two gentlemen (they are truly
gentlemen) are fine engineers. I would put a LOT of
faith in their converters to perform well, be
reliable, etc.

The K2, by the way, is one of the few radios available
today whose receiver comes close to the performance of
the 850 - at least insofar as I have compared
receivers.

It is actually the IF OUT jack. You can use it as a transverter output ONLY if you move a cable on the RF board. Basically what you are doing is moving the output that goes to this jack from the IF out signal to a low level RF signal aprox. 2mW output. I went one better and actually installed a jumper between the output from the RF preamp and RF power amp board. But twice I forgot to turn the power down and blew the front end out of the transverter!! <shaking my head at this point>!

Yeah, but you got to admit Bill, they do look nice. I may get a
TenTec 2m unit for the 920 to work the local repeaters. Nice thing
about the 850 was that it will show the actual operating frequency,
be it 6m, 2m or 440!

# 1210. TS-690S audio output, display, AT-450 rec.

From: n7ioh
Topic: 1210  Message: 1210

I need help with three different problems. First, is there a way to increase the speaker output, i.e. a pot to adjust or something? Second, when I turn on my radio after it has been setting for some time it takes 2-5 seconds before the display comes on. I talked to a tech and he said to not worry about it. Anyone here have any idea what it might be and how to fix it? Third, I read a mod that allows the AT-450 to work on Receive as well as transmit. However the mod was done on a factory installed AT-450 and the insides are slightly different. Has anyone done this mod on a none factory installed TS-450S or TS-690S?

1. is the speaker level still low on an external
speaker?

2. The tech is right on the display.

3. You can re-wire the AT for receive... only reason
to do it is if you are on a G5RV and work a lot of
10-15 meters, it will help the receiver somewhat,
other than that it's not really worth doing. Receiver
is plenty sensitive in most cases.

If the 450 display is the same circuit as the 850, this is normal. Three or four times on this reflector someone has noticed their 850 display taking up to 10 seconds to turn on, but this is mentioned in the 850 manual as normal, especially when it has not been used for a while.

The vacuum fluorescent displays do have filaments that
need to heat up a little, believe it or not.

If you have a 450/690/850 that lights up right away,
count your blessings, hi!

# 1214. TS-850 and AT-250

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-17 18:37:58 UTC
From: dpatt7
Topic: 1214  Message: 1214

Gentlemen,
Can you connect a 850 to a 250 with a remote cable?
I have connected my automatic tuner to the TS-850 and manually changed bands, but if I understand it correctly, you could change that band automatically when you change the transciever freq. if you had your transciever connected to the AT-250 via the remote cable.
And where could I get that cable if it is usable?

And I have a Autek audio filter that I used with my Heathket SB303 and 401 many years ago. Would this work with the TS-850 or should I purchase the filters at $130 a crack?

And.....
Is there an alternative to the DSP-100 filter. They are rare and expensive. Is there a after market DSP that could be used?
Just curious.
Thank you for any time you might spend anwsering this.

OK Dave I will try.

not sure on the AT-250.

You can use any audio filter you want with the 850 but
it will not have the same effectiveness as the IF
filters. While you may not be able to hear the QRM
that the audio filter takes out, the rig's AGC loop is
still looking at it; if the QRM is sufficiently
strong, it will mute the signal that you are looking
for.

If you are a CW lover, definitely get the IF filters.
If you sell the radio you will nearly get your money
back.

Dave,
Check out this link for a band decoder...

http://www.dk9ip.de/DK9IPprojects/DK9IPdecod/dk9ipdecod.html

> Is there an alternative to the DSP-100 filter. They are rare and
> expensive. Is there a after market DSP that could be used?

The DSP100 is so expensive because of not so much what they do on
receive, but what they CAN do on transmit. They are selling for more
now then they did when it first hit the market in the early 90's. I
have often thought about a substitute, but never could come up with
anything. I am now researching the DSP on my FT920, to see what can
be done as far as increasing the fidelity. Of course, with all the
hubbub now about wide-band SSB and the interference it causes, they
may become more available. If you plan on using the DSP for receive
only, buy yourself a Timewave DSP unit and take the family out to
dinner. You will still have a couple of hundred dollars left over!
If you want to widen your SSB signal, you'll have to keep looking for
a DSP100.

73,
Max

Often the Audio IC can fail and also the largish
blocking cap, these are the uPC2002v chip and a 470uF
at 10V cap.. I would feel better with a 220uF at 16
volt cap.

uPC2002v is subbed also by the TDA2002 but NOT by the
LM383 which will oscillate in this circuit.

Let me know if you have trouble finding these parts.

Thanks Bill.
Guess I will use the filters. Like cw and ssb.

Thanks Max. Will check out the decoder.
Guess your right about the dsp100
it certainly is popular.

PS there is no alternative to the DSP100 that will
give you IF dsp.

Keep your eyes peeled and cash ready! You will find
one.

I recommend the IRC filters for the 850 if you can get
them, better shape factor. I don't recommend going
any narrower than 2.1. I prefer 2.7 stock filters,
but that's me.

I've been thinking about the IRC filters. What would you recommend for CW? 400? 250?

Zack if you are the casual CW op with an occasional contest thrown in, you will be happy with the 400hz filters.... I use the 500's stock filters and am quite happy with them except once in a great while, but then I use my "wet processor" to sort out the QRM and move on.

If you are a serious "for blood" contester or have 320 countries confirmed on CW, go for the narrower ones!

The wider filters allow you to cruise around for a QSO or another SS multiplier without having to use the wide filters to find the activity. I often use just one of my 500's to get the right selectivity. I honed my CW skills on a Halliscratchers SX-101 so I am used to the broader band "narrow" filter definition.

Keep in mind, if you have 400s and use them both you will have an actual bandwidth of 200-250 hz; Both 250's however may be a bit too narrow at 150-175 hz, and may "ring" a bit which might slow your code copy down a hair.

If you get the 400hz filters you will be very happy with them, unless as I said you are needing only a few countries to have "worked them all"!!!

Topic: 1224  Message: 1224

July 22, 2003

I have emailed Pacific Parts more than 2 weeks ago and had gotten no responce.

Can someone else point me where I can get the DDS for the TS-450 (YM6631 or YM66312)?

My friends TS-450 has been on the repair bench for more than 2 years and it was only lately that we diagnosed it to be a DDS chip failure. There is no Kenwood authorized dealer or repair center here in the Philippines. He is willing to pay for the cost of shipment if someone can possibly sell that particular part to us.

Thank you.

Dennis Ls. M. Cruz
the Philippines

From: Bill Smith
Topic: 1227  Message: 1227

What is the part number of the TS-850S display board?
I want to replace the B+ electrolytic capacitor on
this board that has history of leaking. Where is it
on the board?

73,
Bill

# 1229. Re: [TS-850_450_690] TS-450S display show dots

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-07-23 19:08:28 UTC
From: Zack Widup
Topic: 1229  Message: 1229

I looked on the web for a solution for this and didn't find one.

I don't own a TS-450 but I have a TS-440 and a TS-850. The problem you describe is common with the TS-440. It comes from VCO unlock problems.

On the TS-440, you have to remove the VCO board and find all the parts that have been covered with a plastic cement. The cement (glue) is yellow when first applied at the factory but deteriorates over time and turns a dark brown color. It then absorbs moisture and starts looking like a resistor. It unstabilizes the VCO circuitry.

I repaired my TS-440 by removing each part affected by the glue and scraping it off the parts and the VCO board, then putting them all back on the board and doing the VCO calibration routine outlined in the TS-440 service manual. That solved the problem. But it is a long and tedious process to remove all that glue!

I don't know if the TS-450 also has this glue on the VCO board, but I would suspect the problem with the dots on the display is also due to VCO unlock.

Good luck!

Two TS-850S are cheaper than one FT-1000D. One would think that
would have at least SOMEONE on the list doing it. Someone? Anybody?

It would be interesting to hear how that works for those who do it.

Hopefully, the excellent performance numbers presented by the ARRL
would be borne out by an absence of interference from one rig to the
other.

You can slave one to the other, to use as
transciever.. saw that in the user's menu list in the
book.

I don't think I could handle two-850's.. can barely
handle the drake B line! By the time I get the Drake
transmitter zero-beat to someone calling CQ, someone
else already has 'em! waaahhh

# 1238. TL-922 manuals

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-01 03:23:55 UTC
From: cawolff@terra.com.br
Topic: 1238  Message: 1238

Hy All,

I´m needing the manuals (owner and service) for the TL-922 linear amplifier, can somebody help me to obtain those??

Thank you in advance.

ZZ5CAW :-)
Carlos

Welcome to Paul, G7VAK, and others that have joined our little group recently.

Paul's Yahoo profile is certainly interesting.

Interesting note: first ever "unrepairable" TS-440S just left my bench. Hated to do it, but 6 hrs into doing all the things I normally do to restore VCO-1 to operation, including replacing all active and most passive devices in the one oscillator that was dead, to no avail, left no choice.

The owner operates his rig in a solar-powered home with unknown glitches and exposure to lightning hits and Lord knows what else. Mountain living does have it's down side.

73,

Bill K0ZL

Hello Bill and List
Thanks for the mention! I am deeply involved in the subject
mentioned on the profile [also the moderator of the group on there].

I am just about to acquire a TS850 and wished to know a little more
about the beast before tomorrow. [Nothing like being on top of
matter in time]!

If anyone could tell me if there is auto tune for the antenna and
also the facility to vary the power o/p I'd be really obliged.

I also service my own gear -- saves a bomb to say the least.
73 for now
Paul

OK Paul. Congrats on the new rig!

If you told us what you do you would have to kill us,
right? hehe

On your questions, yes the tuner is easy to auto-tune,
just press the thru/auto button in, and then press the
TUNE button right below it. Better watch carefully or
you will miss it, it's that fast.

On your power, yes both power (actually ALC limit) and
CAR (for CW, AM, FM and RTTY modes) are adjustable.

You use ALC to limit your power output, then the MIC
GAIN (fone) or CAR (others) to keep the ALC reading
on-scale. Unless you run PSK31, in which case you turn
the mic down to stay OUT of ALC action entirely.

Hello Bill
Thanks for the info - it's very difficult to work out what you need to without having actually seen the beastie as I'm sure you would agree.
I can now look at antennas etc. Being a morse man the seller didn't have a mike to throw in as well, bit I have a hand mic I'm sure I can configure to set up.

I am only involved with the numbers on a recreational bent; I actually work in a University so no assassins on the trail!
Thanks for your advice.

Ron,
check out www.mods.dk Click on the Kenwood tab, then scroll down the left side menu until you see TS850. Click it and you will find your answer. Kinda makes me jealous, as us VE hams don't yet have access to 60m.

Max

The TS-850SAT has a built-in antenna tuner. Mine works great. Even tunes my 40 meter dipole to 160!

You can vary the output with the carrier or mic gain knobs.

I've had the rig open a few times and did a couple mods. For me, it's pretty easy to work on. Nothing is really hard to get to. But I worked for 10 years in an electronics repair shop and I'm used to taking equipment apart. :)

Hello Zack
Thabks very much for the reply; I too have modded a few sets in my time - I started with valves and migrated to transistors [three legged fuses]. Always found valves more resilient to abuse!

Where surface mount is concerned I have to use a magnifier; the eyes are not as good as they were 30 yrs ago.

# 1247. mc-85

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-05 21:56:50 UTC
From: Jean-Guy Landry
Topic: 1247  Message: 1247

Hello Group,
Recently bought an MC-85 mic to compliment the ts450. Of course i do get nothing but great audio , don't change anything, leave it as is. Rather please with all of that.
Before buying the mic, as they are still a lot of $$, i borrowed one from a friend of mine to try. Got same results, great audio.
There seems to be a problem with one of the mic's, either his or mine, as both mic dont act the same at all, not in the end results but in the sensitivity of both mics. His is extremely sensitive, and i mean extremely, you can be about 20 feet away and if you have the vox on the rig, it will key it up. Now mine on the other hand is not as sensitive at all, even we use the same settings and have also tried both mic on each others rig.
What could be the cause of that, and which one is better, is there a way a person could check them out let's say on a workbench. And how sensitive is a mic suppose to be anyway .
Like i was telling my friend, i sooner have mine, as i dont get as much background noise getting on the air.
Now i have been in ham radio for a number of years, and yet have i seen a mic that sensitive. But i guess it does work for him and he likes it, and mine works for me and i like it.
THis is just to find out what is what between the 2 identical mics.?

Thanks for taking the time to read this.

Check the settings of your friends VOX controls. These can be
accessed by the two small holes in the left side of the rig about
half way back on the bottom chassis half. The one on the right is
the ANTI control. This should be set to keep the VOX from keying up
on loud sounds from the speaker.

The one on the left is the VOX sensitivity control. This controls
the sound level needed to key the VOX. I'd bet that your friends is
turned up much higher than yours and could stand to be turned back a
bit. They can be adjusted with a larger jewellers flat bladed
screwdriver.

Hope this helps,
Steve, KE4MOB

I am not too familiar with the MC-85, but if they require a 9V battery, did you check the condition of both? If one is down, it will not provide the same gain in the mics amplifier.

Thanks group for looking into this matter. Looks like we found the possible cause of mic being more sensitive at one place than the other. Actually both mics in the same shack act almost the same. Looks like it is a combination of acoustic of the room by looks of it. As my mic at his place is a lot more sensitive that at my shack and visa versa. Plus he id have the gain set-up on the 850 a bit higher. At this time it is the only thing we could find and more a sort of conclusion.
As these mics are extremely sensitive, example, we were on the air last evening and I could hear the A/C going from his shack that is 3 rooms away, and hear his wife talking on the phone 2 rooms away. But here at my shack, my surrounding are a lot quieter, so nothing heard at other end but the audio. So I guess that room acoustic will do weird things.
Thanks for helping out group and all have a great week

Sounds like your friends' mic gain is too high. Have him try this test:

Place a wattmeter and dummy load inline on the lowest setting possible. Switch to LSB or USB and key the mic. Don't say anything into the mic...just let it pickup the ambient noise. Now check the wattmeter. If it's higher than zero with no one speaking into it, the mic gain is too high.

I have two (soon to be three) toddlers running around in the shack sometimes, so I have to keep my gain turned down pretty low and my VOX off...I can just imagine my 4 year old announcing to the world on HF that my two year old is "running around naked" again!!

There is an LCD ass'y, B38-0350-15.

There is no B+ line on this board, only +8V and +5V, with C7 and C8 being the filter caps for these lines. These are both 100uF at 16V, smd types. There is also a C18 showing on the board layout, but not in the schematic. There appears to be a lot of stuff not shown in the schem such as the dimmer circuit, the inverter circuit for the CFL tube, etc.

Al, best bet (if not here) is ebay, go ahead and pay
the price... hard to find the filters on the plug in
boards; should be in the 75.00-90.00 range.

Also check pricing at Internatational Radio for their
filters, if you haven't already.

Many of the amateur dealers carry the used filters. Burghardt had several plug-in Kenwood filters, last time I checked. Check the web or call around, if the list members don't come up with anything.

Topic: 1258  Message: 1258

While using the mic gain to keep the ALC within the red line I have found it requires frequent adjustment. It does not stay adjusted long. I drive a linear amplifier with the rig using the keying interface found on the 850S repair page. This happens with the auto tuner on or off. Anyone else experienced this?

W9GOC / Frederick, here.
Nothing noteworthy, I'm afraid.
Ham activities:
VE, EmComm mentor, ARES/RACES AEC.
President of Four Lakes Amateur Radio Club in Madison, WI.

My current radio-related activity is focused on getting my antennas and
tower re-installed, so I can perhaps make a QSO or two. :-(
[small village politics and interfering neighbors...]

73 to all, and hope you'll enlighten me on the things I should know about a
TS-450!

---

# 1264. TS-850S/AT for Sale

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-16 06:14:36 UTC
From: D.Cy Gacuzana
Topic: 1264  Message: 1264

Going to try a Pegasus!
Yes, the 850 & white winged pony are not even in the same league!
850= serious DX/Contest radio.
Peg= rumored to be fun, different, okay wow factor, space-saving and great for casual operating in non-overcrowded contest or non-massive multi pile-up conditions.
I just don't have the time for real contesting at this stage in life.
Full story of 850 for sale can be seen on eHam Classifieds under HF Radios search on 850.
If interested, small picture and details there.
Wellness to All.
73, W3DCG.

# 1265. RE 850 for sale...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-16 15:38:32 UTC
From: D.Cy Gacuzana
Topic: 1265  Message: 1265

I just cannot bring myself to do it!
I change my mind!
Maybe after several months of the Pegasus, I'll see if i HAVE to sell the rig.
At this juncture, i thought I had to, but a windfall occured, and so,
What can i say besides Kenwood may never make a receiver as good as they made the one in the 850. If I sold it I KNOW I'd regret it some day. If I become unemployed someday I might let it go.

Thanks for the post and the response.
73.

hi hi! Tnx Bill.
You know, they do not even-
make the KNOB like that anymore!
Your are totally right tho, as I now have about 1150.00T into it. The only missing part as compared to the newer rigs in this range is DSP/noise reduction.
Otherwise, for pulling the just below the noise signals out of the mud when the plus S9 signal is 1-2 Khz away, the 850
simply, BLOWS DOORS, even today.

Of course this becomes evident only in massive pile-ups and big contest weekends when working normal to weaker signals. And I was planning on doing the NA Sprint a few times!

# 1277. TS 690S Receiver Dead

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-19 00:17:32 UTC
From: kd4em
Topic: 1277  Message: 1277

My almost 10 year old TS 690S has lost its receive sensitivity, it can only very weakly receive a couple of strong broadcast stations and a strong 6 meter repeater. I sent it to Kenwoods eastern service center & they returned it to me the day after receiving it saying it was lightning damaged and not worth repairing, need to buy a new radio. I suspect the problem is not too major (diode, transistor etc) on the RF board. Has anyone had this problem or could offer any suggestions? I hate to just throw it away since transmit and all other functions seem to work. Thanks in advance for any help or ideas.

Doug, you might try contacting Burghardt Amateur Center. I have read very good reviews on eHam.net about their service with Kenwood radios that were in very bad condition. You can contact them at service@... or 1-800-927-4261. You can go to www.eHam.net/ and read the reviews of Burghardt and others under, "Amateur Radio Equipment Repair Service".
Also I saw an add on www.eHam.net/ for a person looking for a used TS-690S for parts if worse comes to worse. His adds were posted on August 7th and the 15th. Contact Tom KC0PLH, 417-883-1686 or nbclitom@... .
Also saw two TS-690S radios for sale on eHam listed July 12th and July 20th. And if you don't need 6 Meters there was a TS-850 listed today for $950.
Doug, hope you are able to get that radio fixed, I love my TS-690S. I was going to sell mine about a month ago but canceled the add, to good to sell.

I bought an 850, third owner of the unit, and the first and original owner had it touched by lightening. How bad? I don't know, but usually they are 'on' or 'off' and it was some of the transistors and diodes. Places always say it is not worth fixing, well, of course they want you to buy new--from them!! The way I see it several hundred dollars is worth it as it sure beats the price of new and it is worth it to me--much life left. I plan on keeping my 850 alive as long as parts are available and one more thing, the 850 has better receive than the ts 2000. I own both.

Eric

Topic: 1277  Message: 1280

Hey I've blown my 850 up three times... twice on lightnin', and once on an amp that I was GOING to fix for a guy... seems he "forgot" to tell me that because of the way he had it wired for 230, it had to be "connected to earth ground" to "work right". Crap. Guess where it found ground? Yep, thru the 850! well natch it blew up everything that hangs on the SS line to key the rig, so it was stuck in TX mode 8 ways from sunday. Then of course D30 blows, and so on and so forth.. I didn't know that rig could be keyed up in so many ways! (COUNT 'EM: MIC; CW KEY; CW KEYER; VOX, AT UNIT; EXTERNAL SS (filter cap was shorted); FORGOT TWO OTHERS!

hehe

"Thunder is good; thunder is impressive. But it's lightning that does the work." (Sam Clemens). Work, indeed...

# 1282. Re: [TS-850_450_690] TS 690S Receiver Dead

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-19 12:20:42 UTC
From: Bill
Topic: 1277  Message: 1282

I have repaired it each time.

I am very happy with the rig. If they were to build
radios to withstand nearly every perturbance that
comes along, we couldn't afford them (except the
FT-1000, seems to be nearly bullet proof).

> > both.>>

I got my 850 from eBay, looked super, came with filters, original boxes, hand mic never was used. RX died. Sent to N4DA. It crapped out a few days after his warranty period. Fine, it was another FET and diode farther down the chain. But- He never returned my calls nor emails.
I emailed AVS/Kenwood Service East. Steve Schrader did a good job on it, or his techs and he. Seems like there are now 6 new FETS and a few diodes, and it works wonderfully. I'm keeping it. The 850 ROCKS.
I just received a Pegasus. The DSP is ok. The receiver in the Pegasus in NO WHERE NEAR the 850. Apples and Oranges on A/B. I'll keep the Peg, it's fun.
However, truly, for the cost, and factoring in repairs, I'd say I've paid 300 more than what a new 570DG would cost. But- the filtering schemes available in the 850 place it still as a better radio IMO. For weak signal performance in the presence of strong signals, the 850 handily out paces. Check QST Reviews BDR/MDS figures 500Hz filter. The BDR figures of the 850 truly blow doors on anything available today in the same price range, and beyond. Operating the 850 confirms the figures. If you cannot dig the signal out on an 850, it cannot be dug out on any other radio!
Unless your have say, an Orion with several antenna configurations, and optional crystal filters, and take advantage of Diversity Reception (one receiver listening on say a beverage or Vertical, the other on a different say beverage or other wire antenna, and using the balance circuit to mix it to your headphones, Left and Right simultaneously). Yaesu can equal and rival, but due to me doing CW a lot, and Yaesu 1000D and MP and Mark Five suffering poor CW waveform, READILY apparent in Fast QSK mode,
I never considered Yaesu, even if I could pay over 2 grand for one and a few hundred more on filters. Orion can rival too! At what cost? hi hi.

I had an EXCELLENT experience with AVS/Kenwood Service East, and the bill was around 200 bux for me, including shipping!!! Steve Schrader runs an honest boat, and they are good. They fix all manner of Kenwood appliances, but roots are in Ham radio.

FYI, 73,
W3DCG.

# 1284. TS 850 Antenna Tuner Mod in September 2003 QST

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-08-19 17:52:26 UTC
From: Cindy Kozwoski
Topic: 1284  Message: 1284

The factory set antenna tuner only tunes the
transmitter output. The mod allows the tuner to tune
both the receiver and transmitter (except for cross
band operation). Cindy.

Cindy,

Check out the mods folder in the files section. I wrote the very
same mod up in June. I wonder if someone has copied my work and
sent it in for publishing.

Are these two the same as the tuner mod that came out shortly after the
850 was introduced? That one is available at several web sites, as well as
QST and Hints & Kinks, as I recall.

I really think this is one of those deals that more
than one person arrives at a similar solution at the
same time.

Hello Folks
Regarding my intention to buy a 2nd hand 850. I eventually did.

What an excellent piece of kit - recently had a qso into Norway using 25W on 80M. Amazed how easy this unit is to get going after a slight confusion over the tuner. [Always read the masnual after you mess up the first ten attempts]!

Thanks to those of you on the group who advised me when I was considering the worthwhile purchase.

hi all

declan here from Ireland,just joined the group looks
great keep up the good work lads,some info on myself
I'm 17 years old and have a KW TS690+DSP100 and also
the MC60 desk Mic,i was wondering if any one could
suggest a good setting for me to use my dsp100 on, i
don't have it long and would like to use it to its
full potential,i would be mostly using it on the ssb
modes for dx any suggestions would be great,thanks in
advance,

Declan

Welcome Declan and thanks. Enjoy the group.

I have not a DSP100 so can't help you there... best
thing is get on-air reports and see what sounds best.

Cindy -- Change the battery. Take a look at the Photos
section to this page (left margin). I posted there a
picture that shows what to do. Not obvious is the
fact that you must loosen the circuit board that holds
the battery and cut the leads from the battery to the
board. It's a good idea to clean out those solder
points. The pic tells the rest. 73 --Charlie K6HTM

# 1297. Re: [TS-850_450_690] TS 850 Lithium Battery Replacement

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-09-09 23:47:54 UTC
From: Bill
Topic: 1295  Message: 1297

Firmly grasp both sides of each ribbon cable on the top edge of the board, right where they go into the edge connectors and work them out. They will plug in the same way.

Remove all screws from the control unit so it will drop down, top edge toward you.

Unsolder the batt. You will have to heat each batt connection point and gently pry the batt out one leg at a time, as these holes rarely desolder cleanly.

When resoldering the new batt, make sure you use a grounded iron AND that the radio is NOT REPEAT NOT grounded; lest you short the battery with the iron.

# 1298. TS570 "hidden menu"

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-09-19 12:16:44 UTC
From: Max
Topic: 1298  Message: 1298

I realize this is off-topic, but I have a problem. Any users of the TS570 on here who might be able to help. I need the default menu settings for the s-meter calibration. This menu is accessed by shorting pins 8 & 9 (ground & PTT) on the accy plug, then pressing and holding the [LSB/USB] & [N.R.] buttons down while powering up the radio. This brings up the service adjustment menu. I need the values for menu items 2,3, 4 and 5.

I would be interested in all the menu values if someone could e-mail them to me so I can keep in the service manual.

Thanks,

Max

Topic: 1298  Message: 1299

As you indicated, you have the svc manual and the values are not in there... because they are different for every rig. Another 570 owner may be able to give you theirs for starters.

For SSB squelch, try setting your rig in SSB, adjust the squelch on dummy load to 9 o'clock, and change menu setting 2 so that the speaker just opens. Then close it.

For S1, again on DL, set so S meter just barely comes off of first position.

For s9, find any of the big guns on 20 during the day, and set them to 10 or 15 over.

For full scale, go to your local AMBC station on a longwire.. that should do it.

Now, question for you: This will only work if the radio is in operating mode as the calibration settings are being done; when you put it in menu setting mode, can you in fact operate the controls to gain the above conditions?

That is the route I took Bill, and it has given me a good starting point.

> For s9, find any of the big guns on 20 during the day, and set them to 10 or 15 over.

Unfortunately in the adjustment menu you have no idea what frequency you are on.

> For full scale, go to your local AMBC station on a longwire.. that should do it.

See above!!

> Now, question for you: This will only work if the radio is in operating mode as the calibration settings are being done; when you put it in menu setting mode, can you in fact operate the controls to gain the above conditions?

Not all the controls work when in adjustment mode. I have figured out how to calibrate the s-meter. Depending on the signal level coming into the antenna jack, when you hit the up or down button it stores a code. So either you remember what the code was for your particular radio, or use the calibrated output of the signal generator and hit the button as per the signal level. Tedious, but accurate!

Welcome to the group Stu,

I would check out the INRAD filters. I think they are a little
sharper thann the Kenwood equivalent, and probably a bit cheaper
too. The 850 is a great radio. And they are very well known for
their beautiful SSB audio. I don't think there is a bad thing to
say about them! I am currently running a TS570SG having owned an
850 a while back. Will probably pick another one up in the future,
really miss mine, although I am enjoying the 570.

Stu the Kenwood filters work fine in mine, but I think if I had it to do over I would get the 400 hz filters from Inrad; I installed a pair in an 870 and it was AWESOME... like 250 hz brick wall when both were turned on, but still able to copy up to my limit on speed.

I certainly would like to have the 870 Bill. They are not too badly priced on the used market. I am really enjoying the 570. Dropped a 3 khz filter into it from a 930 and the audio soulds very crisp. Of course the studio mic and EQ help too!

From: James Baldwin
Topic: 1306  Message: 1306

My TS-450 SAT has a new problem. The s-meter is stuck in the full right red position and there is no audio output. Sometimes when I wiggle the RF Gain control the meter slowly backs down to normal and the radio works fine. Next time I power up, same problem. I assume the RF Gain control switch is going bad, but maybe there is more to it? I've checked all the other obvious controls such as Squelch. Does anyone have any advice on checking/fixing this myself?

Thanks

Sounds like it could just be the control. With the RF gain fully round the
symptoms are the same. Maybe worth a little switch cleaner as a test
before replacing the control.

Topic: 1306  Message: 1309

Yep, you diagnosed it: bad RFG control.

The combo AF/RF pot is R19-3433-05 from PacCoast or EastCoast Parts. It is not easy to get out; I use a modified metric nutdriver that I had a machinist take some meat off of the outside diameter of the socket so it will fit in the panel hole (there are two vol control nuts you will need to remove). The VR is mounted on a small pc board; once you get it out (covers off, front panel rocked downward), it's fairly easy to unsolder and replace the control.

Get a new mem batt while yer at it: W09-0514-05. Note, when changing this batt, be careful not to short the new mem batt by using a grounded iron with the rig plugged into DC supply or antenna system.... "float" the radio chassis so you won't do this.

Also place a small (3/4"x3/4") piece of electrical tape under the new battery, on the pc board. This will help prevent damage to the trace that supplies 12v to the AT unit if the new batt leaks in the future.

OR you can put in the coin cell holder and two wires, as has been posted about in the archives.

Oh yeah, how about 60M transmit? Need the out of band mod for that! Pick that up on www.mods.dk.

While you are there, why not remove the vfo knob and put a drop of oil on the encoder shaft, right at where it goes into the bushing? You will need a 1.5mm hex wrench (Allen wrench) for the knob screw.

73!

# 1310. 850 In Rads or Kenwood

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-09-26 18:00:08 UTC
From: D.Cy Gacuzana
Topic: 1310  Message: 1310

Hi there, I got my 850 on eBay, had to send it in for repairs- total cost about the cost of a 570SG NEW, including shipping (during promotional offers). But AVS East ended it up truly almost new. I was going to sell it but could not bring myself to do it. The first guy I sent it to I wished I had not, and he charged much more.

It came with stock Kenwood filters, when I bought it. 500 Hz in both IFs.
I have to say, this radio's receiver is phenomenal. Last night a station below the noise called me on my Pegasus- no joy. I was encased by two 10 to 20 over nine signals on 40m, one about 1.5 Khz up the other between .5 and 1.0 Kc down. The caller never had a chance- we never had a chance. RF DSP and PBT and 300Hz, the white winged pony just couldn't come close to pulling him through.

However, I swtiched to the 850 for the rest of the night not wanting a repeat.
It happened again, but only one strong station 20db over nine, less than .5 Kc away.
Even though it was only two 500Hz stock filters cascaded, I was able to RIT the QRP station, Notch him in, and still complete the QSO (the QRM station called CQ and didn't even know freq was in use, couldn't even hear the QRP station).

I have had numerous occasions of hearing and completing QRP qso's with the 850, and DX QRP. The 850 receiver is truly phenomenal. Couple that with the cost, and the awesome QSK, if yours holds out I'm sure you'll be impressed with the filters installed.

Had not mine come with the stock units, I'd have gone for In Rads. Oddly In Rads are often less spendy but steeper skirts- but for some reason the InRads for the 850 seem priced higher.

I purchased an InRad 250 for my Corsair, and was very pleeased.

I'm slowly getting over my microphonophobia as well, but CW is music to my ears.

# 1311. Re: [TS-850_450_690] 850 In Rads or Kenwood

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-09-26 20:13:16 UTC
From: Zack Widup
Topic: 1310  Message: 1311

I've been thinking of getting the INRAD CW filters for mine. I am also mainly a CW op. Maybe after my next income tax refund! :-)

I've gotten interested in LOWFER experimentation and I'm excited about what the TS-850 can do down there. I'm building a 5-ft diameter receiving loop to put up outside on a rotor. But I get WWVB on 60 kHz with a short length of wire.

The rig also works great on 60 meters if you do the mod to open up transmit on all HF frequencies. The only SSB contacts I've made in the last few months were on 60 meters.

I've been able to pull stations out of the noise lately that others evidently haven't. I've worked some 40 meter DX that had pileups at the DX station's sunrise (Africa) but was still able to hear and work the DX station well after his sunrise, when most people in the pileup lost him and had given up.

Nice report, Darin. Sorry for the repair costs. Next time, call me! :)

The only rigs I have had here that topped my 850 were the 870 (but I like the 850 front panel better) and the FT-1000D with the right filters. Differences subjectively speaking were nominal however. The 870 does have a superior AM bandwidth and detector but that is of moderate value to most ops.

> Seems like a nice radio, have it next to the IC-765,
> we shall see.
> 73

> Stu kw8k
> Mostly CW, frightened of microphones.

>>Welcome to the group Stu,

I would check out the INRAD filters. I think they are a little sharper thann the Kenwood equivalent, and probably a bit cheaper too. The 850 is a great radio. And they are very well known for their beautiful SSB audio. I don't think there is a bad thing to say about them! I am currently running a TS570SG having owned an 850 a while back. Will probably pick another one up in the future, really miss mine, although I am enjoying the 570.

# 1314. slightly sick TS690.

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-09-27 20:15:46 UTC
From: Alan Hensman
Topic: 1314  Message: 1314

Hi Folks.

Can anybody tell me if they have come across this problem and do you know the cure?

Got a 690 up at the radio club. Its on a variable psu and it looks like someone had used the psu at 9v and not put it back to normal.

turned radio on. extremely quiet.

noticed that the psu was low and put it back to 13.8.

problem is that now we have no audio on RX SSb /CW.

All seems to be ok with AM / FM.

Its as if the squelch is full on all the time on the ssb, (checked it and fully anticlock) we can see the signals as per normal on the meter.

Also we can hear a very faint "whine""single tone" in the background on ssb/cw.

Any help at all would be appreciated as this is the main HF set at the club.

Cannot even find a service manual anywhere, rang kenwood over here in uk and they wanted £70 ($116).

Many thanks and sorry for the long post.

Alan 2E0HGV

Topic: 1314  Message: 1315

Hi Alan, well sorry for your problems.

I doubt that the low voltage caused the problem, although it sure seems related but it may be just a coincidence.

I am thinking that you took some kind of static hit to the radio.

If AM/FM works and SSB.CW doesn't then it is a failure of the local osc that acts like a BFO for the older rigs did... it's only ON for those modes. I am thinking that a switching voltage has failed there.

The whine may be a leaky diode in the rx/tx RF switching chain at the antenna; the RF filters are shared between RX and TX; if a diode is leaking through, it would cause the whine, plus low or no sensitivity and may also be inhibiting the local oscillator from working properly.

On your PC boards under the rig you will find some tiny solder pads or feed-thrus that are labeled RXB, TXB, and 8A. RXB needs to be very near 8.00 volts on receive; TXB, in TX and 8A, well, always!

Check those and come back.

Date: 2003-09-28 01:41:05 UTC
From: dpatt7
Topic: 1214  Message: 1316

Does anyone know where I can get the cable from a AT-250 antenna
tuner (8 pin din plug)to a TS-850 remote terminal (7 pin din plug)
to operate the tuner with the transciever. I had one once but
cannot find it. Would make the cable but eyes not what they used to
be. Involves 2 din plugs...7 pin and 8 pin and shielded cable between.
Looked at internet..no response.
Thanks

I just downloaded the program and set it up for my TS570S. This has got to be one of the slickest control programs I have ever seen. Many options and the on-screen display is way cool. Too bad I have to go to work, will have to wait until tonight to play. Was planning on hooking up my SGC 239 tuner tonight. Biy there just aren't enough hours in the day for ham radio!

It is not easy to get out; I use a modified metric nutdriver that I had a machinist take some meat off of the outside diameter of the socket so it will fit in the panel hole (there are two vol control nuts you will need to remove). The VR is mounted on a small pc board; once you get it out (covers off, front panel rocked downward), it's fairly easy to unsolder and replace the control.
>
> Get a new mem batt while yer at it: W09-0514-05. Note, when changing this batt, be careful not to short the new mem batt by using a grounded iron with the rig plugged into DC supply or antenna system.... "float" the radio chassis so you won't do this.

Hi Bill, I have forwarded the info you suggested to one of the cleverer blokes up the club who is looking at the radio,

and the reply to me was......

Everything checks out until the last stage, until the demodulater chip, which is generating a tone of 1.2k.

Everything is perfect on TX.

So we are ready for any more ideas that you might have.

Thanks, Alan

I am at a dead end.

If you can located the LO output of the DDS chips and look at it with a scope, the two sigs should be a clean sine wave with no modulation.

I have owned my TS850 for going on 10 years and love it. Did you wonder why Kenwood diddn't put a spinner knob on it? Well I have often wondered why and thought that if the proper replacement knob came along cheap, I would make the change. Never able to find a suitable replacement at a reasonable price, I recently designed the FingerDimple. It is available in gray and black and is pressure sensitive and requires no modification to the radio. Best of all it is cheap and installs in seconds.

Check it out at WWW.FingerDimple.com a photo of my TS850SAT sporting a dimple is on page two.

# 1324. Notes on TS-450S battery replacement

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-04 14:29:12 UTC
From: smatda
Topic: 1324  Message: 1324

I was going thru some old computer motherboards last night...most of them were DOA for various reasons. But I discovered most of them had good batteries and holders on them! My 450 has been needing a new battery for a few months now (I took the leaky one out and hadn't ordered a replacement) so it was an easy task to unsolder the holder off the defunct motherboard.

Looking at the board in the 450, I decided to slightly bend the pins on the battery holder together so that I could use the positve contact at the 11 o'clock positon (adjacent to C6). Unfortunately, the projection housing the + contact on the holder was a little to wide to clear the capacitor, so a bench grinder worked like a charm to remove the extra material (a dremel would work well too).

The result is a battery holder that looks almost like it was original equipment. The particular battery holder I used also stands off the board about 1/8 inch, meaning if the battery does leak, the board shouldn't get damaged.

Just something I thought I should pass along.

# 1327. Using Ts850 or 450 to Transvert

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-06 10:52:53 UTC
From: Gary
Topic: 1327  Message: 1327

Hi,

I wonder if anyone has has a success with transverting using these rigs. I no longer own an 850 (big regrets) but hope to again.

I used a TS430S to transvert to 2m some years ago and it's sensitivity and audio quality beat todays modern rigs easily.

When I had an 850 I can remember that the instructions for transverting were not straight-forward and as such I never attempted it. But would be very interested to hear the results of those that have.

The 850 relies on the transverter to supply 8v at low current to "tell" the 850 to shut down the finals... that's all I know about it.

Topic: 1327  Message: 1329

I've used a TS-440S with a transverter. It's been a few years and I don't exactly remember the mods I did, but it worked well. The TS-850 is supposed to be tricky but can be done. Down East Microwave sells a transverter interface box specifically made for the TS-850 (the TIB-850). From what I've heard, it works quite well. I own a TS-850 (wonderful rig!!) but haven't purchased the DEM TIB-850 yet. One of these days ...

Hi:

Anybody can confirm if the BS8 pan adaptor for the SM220 will enable the pan display capability with a TS850SAT?

Regards

Mario/YS1MAE

Summer is over (northern hemisphere).

TAke the top cover off your 850, then the smaller cover over the filter unit (7 countersunk, #1 phillips screws).

Look at the glass thing on the small relay board.

Now log into the group, and click on Photos, then the Service Photos folder. Look at the picture of the two glass thingies, just like the one in your rig. Compare....

If yours looks like the one on the LEFT, you have taken a surge and the radio is unprotected. If it looks like the one on the RIGHT, you probably just changed it! hi....

P/N DSA301LA, from PacCoast, East Coast or (gasp) Icom... same part... BUY TWO, one for next time.

Oh yeah, add the 2.2mH choke, will make it last longer.

73,

bill

# 1332. tx power drop off

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-08 20:06:09 UTC
From: bob29ww553
Topic: 1332  Message: 1332

Over a period of time my ts-850 has developed a loss of tx(transmit) power. At first it was on ssb only but now is on all modes. The problem disappears some time but may come back at any time. I suspect "dry solder" joint but am a little slow to attempt same.

My radio is used mainly on receive & with a sp-31 in line with a clear speech noise filter I will never change. But I would like to have the rig in it's full operaring order. any suggestions welcome
Regards Bob

Bob,

Measure the ALC voltage on the DC-DC board. It controls the negative going ALC which determines the output power. Very common problem on the 850's.

Max

I believe that 850's were notorious for cold soldier joints. The unit I
have had the boards shotgun soldiered before I acquired it.

Eric, I have never seen bad solder joints on any of the 850s that I have serviced.

What is "shotgun soldering", I have never heard this term before .

Just get into the board(s) and soldier every components lead on the board. Like a shotgun blast would cover everything in its path and not miss a thing. Of course I did not do the work, an excellent tech did it and I believe he had the right tool(s)

Hello Bill, i have a 450sat here, and i am using an mc-85 mic from Kenwood, and get nothing but great audio report from all, also this mic does have a tone switch on it so you can cut the low's , works well in dxing that way, otherwise for normal qso, do leave it on normal, whatever both ways are great also.
Good luck.

ok Carlos, well you did get lucky! hi hi.

No need for an amp in the Kenwood mics, with the
Kenwood radios... it just adds complication to the
equation if there is RFI.

73,

bill

ok Carlos, well you did get lucky! hi hi.

No need for an amp in the Kenwood mics, with the Kenwood radios... it just adds complication to the equation if there is RFI.

73,

bill

Just about any mic. The 850 would sound good with a tin can!

The 922 is a great amp, very well built.

Look up "tl-922" and "circuit improvements" on Google.

# 1352. TS-450 Memory Selector switch replacement

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-15 15:30:37 UTC
From: James Baldwin
Topic: 1352  Message: 1352

Thanks Bill for your East Coast part number for the AF/RF pot that is bad on my TS-450. Before I make the order I thought I'd replace the memory channel selector switch which is also skipping channels and sticking occasionally, but I don't see the part number for it in the East Coast online catolg. I know it's there, just can't find it. Does anyone have that number and some tips on how to replace it?

Thanks.
James

# 1354. blank display on 850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-21 13:25:50 UTC
From: Kenneth G. Shutt
Topic: 1354  Message: 1354

Hello everyone. I am new to the group. My 850 was purchased in 1991 and has performed perfectly until recently. Yesterday, when the radio was switched on, the display went blank. Everything else appears normal. Both transmit and receive functions are operable. I have tried microprocessor reset which does not help. Any suggestions on what may be the problem?

Hi Kenneth

I am going to guess that you lost the DC-AC converter
that powers the filaments of the display fluorescent
elements.

Bill,

Thanks for your reply. I measured the voltage in and out of the inverter. There was no voltage on either. What should I expect? Do you know of a source for a schematic diagram of the lcd assembly?

73 de Ken - K5GUU

Needs 8v going in, and let me know if you got those scans OK. If not I can post them to the group.

Careful on the output, it's about 110v rms at 28khz... it will light yer fire for sure, just like it does the tube!!!

# 1358. blank display on ts-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-22 14:54:21 UTC
From: Kenneth G. Shutt
Topic: 1356  Message: 1358

Bill et al,

Thanks for the lcd assembly schematic. I found an open trace in the 8 volt supply to the inverter. The trace was open at the + terminal of C18 (470 mf). It looked like the trace was burned open by high current. Incidently, there was an inductor/choke (3 milli-henrys) and the C18 capacitor in the circuit that were not shown on the schematic.

The decision I need to make now is whether to repair the trace and smoke test or do further trouble shooting to determine if a short or some other failure caused the trace to burn out. Any suggestions?

73 de Ken - K5GUU

Topic: 1356  Message: 1359

Check resistance on the input to the converter; if it
is not near 0 to ground, fire it up.

You could use a 1A pico fuse if you want, just bare
some of the trace on either side of the burn and
tack-solder the fuse in.

# 1360. blank display on ts-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-23 12:32:32 UTC
From: Kenneth G. Shutt
Topic: 1356  Message: 1360

Hello all,

The display is now working. I repaired the burned up trace in the 8 v supply to the inverter, smoke tested it and the display came to life.

Now I have another problem. I have no rf output on 80m or 40m. Other bands appear normal. My difficulties started after I installed the receive ant tuner mod. The mod works on other bands, so I do not think it is related to my latest problem. Any suggestions on where to start?

73 de Ken - K5GUU

Ken, is the radio drawing current in TX on those
bands?

If it's drawing 8-10 amps or more in TX and you have
no output, the problem is that the filter unit is not
switching the proper filter relays... could be that
you have not seated the flex connector properly on one
end.

If it's not drawing but 1-2 amps, there is a problem
on the RF unit.

I am thinking you may have taken a static hit, that
first showed on the display problem?

Congrats on that fix by the way, you are about $130.00
ahead of the game by now.

# 1362. TS-850 Mars Mod?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-24 03:42:03 UTC
From: Bob Snelgrove
Topic: 1362  Message: 1362

Hi Guys

I'll be a new 850 owner soon and wanted to ask if any one has done the mars mod on the 850? My serial number is 4xxxxxxxxxx, if that matters!

thx!

bob

# 1363. Re: [TS-850_450_690] TS-850 Mars Mod?

Topic: 1362  Message: 1363

Bob, I ripped this off from www.mods.dk

there are a lot of other goodies in that site for the
850 and many other rigs. Here ya go:

<begin plagerization>
The All-band transmit modificat?on requires the
removal and re- location of a diode on the the digital
board which is located behind the front panel. The US
version of the radio has diode D11 installed, and
diode D9 removed. D11 must be removed, and installed
in the D9 position. This modification IS NOT for the
faint of heart, as it entails removing the front
panel, and the digital board. Note that the digit?l
board has solder holes th?t are through-soldered; that
is, there are circuit traces on both sides of the
board, so make sure that ALL solder is removed from
the holes. This modification will also allow the
antenna tuner to tune anywhere the receiver is tuned.
This modification should ONLY be performed ?y those
familiar with soldering and de-soldering techniques,
and requires patience, and dexterity.
<end>

Bill,
My rig did not need the diode to be re-installed (just removed,) and I thought you told me that yours did not, either. I'm confused!

Same here. I only removed D11, I didn't reinstall at the D9 position.

I am guessing it varies from model to model.

The IF OUT can be hooked to the V. INPUT on the 850 to monitor the received signal only. For monitoring of your own signal you hook it in line with your antenna. Without the BS-8 pan adapter you will only be able to monitor the signal you are tuned to. It will NOT function as a band scope display.

# 1370. Re: [TS-850_450_690] blank display on ts-850

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-25 01:07:30 UTC
From: kgshutt
Topic: 1356  Message: 1370

Bill, I checked current draw on 40m and 80m. It was drawing 8 to
10 amps depending on carrier and power setting. Next I removed
the filter board to check connector seating, general appearance etc.
Everything looked fine so I reinstalled the filter board and checked
the rig again. Now I have no power out on any band. Current draw
is 4 to 6 amp on bands but 40m and 80m. On 80m and 40m current
draw is 3 to 4 amp. SWR reads high all all bands but the 40m and
80m bands. On 40m and 80m everything is the same as before (no
rf or swr reading).

My diagnosis is as follows:

- The original zero output problem on 40m and 80m is caused by a
problem in the filter unit. One or more relays are not operating properly.
I have not done any additional trouble shooting on this problem.

- The new problem on the other bands is caused by a malfunction
in the rf unit. Cause is not obvious.

- I also noticed that the gas discharge tube has a white ring on the
internal tube. It was an open circuit when I removed it. I believe this
tube shunts the ant connector to ground so the rig should operate
with the tube removed (but without spike protection).

- All of these problems sure sound like the root cause could have been
a lightning hit or near miss.

Comments or suggestions?

Progress. The new problem (no rf on any band) has been
solved. An rf connector in the ant tunner was not seated.
It was overlooked when the filter unit was reinstalled.

Now back to 40m and 80m difficutly in filter unit.

# 1373. No RF Output on 40M & 80M

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-25 14:59:56 UTC
From: Kenneth G. Shutt
Topic: 1373  Message: 1373

The cause of this malfunction appears to be a failute of the relay driver IC1 (M54581P) in the filter unit. Any suggestions for a source for this IC?

Ken - K5GUU

Topic: 1356  Message: 1374

Yep, lightnin...

The tube is a DSA301LA, I get them from Icom (cheaper
than PacCoast). If you need one, let me know. While
you are at it, put a 1 or 2.2 mHy choke in parallel
with it. Keeps the DC from building on the ant lead
from wire antennas in the wind.

You have a ribbon connector on that filter unit that
could be fried; it carries the band change info to the
relays.

Thanks, Guys

I hope I can just do the "snip" Do you remove it or just clip on
lead?

Could you post your serial numbers?

Mine is 4xxxxxxxxx, if that matters.

thx!

bob

Ken, in the svc man I see MS4581P, not M54581P.

MS4581P does not show at Pacific Coast Parts at all.
It also doesn't show on Google search. It would
appear that the service manual, page

M54581P shows as "discontinued by manufacturer".

I have left a price quote request at several DX
sources, let's see what happens.

It's not at Digikey or Mat Electronics.

AHHH FOUND IT... SORTA... via the Kenwood EastCoast
Parts site.... they crossed it to an LB1745!! YIPPEE,
still available and 3 bux cheaper...

http://www.kenwoodparts.com/

While you are there you can order the DSA301LA, and a
memory battery W09051405 OR W09-0514-05

OK on the M54581P DRIVER ic for the relays on the filter unit, The sub for this is LB1745, from East Coast or Pacific Coast parts, about 7-8 bucks. I am going to order some, if anyone wants me to add to the order let me know.

73,

Bill K0ZL

It's just a regular diode, snip it... not SMD.

Thought for sure I had picture of it, but I don't yet.

Topic: 1362  Message: 1386

Almost any 20 amp, 13.8v supply will do. I use a kenwood ps-50. I would be reluctant to use one of the new switcters because of noise potential and lack of personal experience.

Topic: 1362  Message: 1388

OK.. Here's my take.

Had an 870 on the bench for a couple of days doing the rx gain re-apportionment mod, and adding some IRC filters, along with two of my DC snubber kits to the antenna leads. The rig was a joy to work on, with easy access to all boards. Also did the 60M mod, I think.

I was impressed with the receiver after the mods (did not get to use it much before); I think it stacks up well to my 850, and the IRC filters gave it a decided advantage in shape factor on SSB. Did not install the CW filter.

I didn't like the noise reduction feature, but I have not heard one that I liked yet... I even hesitate to use the noise blanker unless I have to. All the noise reduction I need is in the filters, RF gain, and between the ears. I just don't like the watery, synth sound of even mild settings on NR.

Same on the 746/pro by the way.

The front panel was OK... I thought the 870 had rubber keys, but they are hard plastic like the 850. But I missed the telephone-style numeric keypad; made direct freq entry a little harder.

On rx, the 870 was excellent with the IRC filters. I was also impressed with the AM reception, pulling a QSO out of the mud on 75, comparable to the 850. Not better mind you, but just as good. Better than the 430 with the AM filter.

On TX, didn't get but one report; but we all know that the 870 sounds fantastic on transmit.

Would I own an 870? You bet! Would I get rid of my 850 to get one? No. It's paid for! hi.

I think the 870 with the gain-reapportionment mod is as good as the 850; add the IRC filters, and it's better. Add the IRC filters to the 850, it would no doubt ratchet the 850 right back up there with the 870. So I think at some point in the future, I am going to have to get the IRC filters for the 850.

73 all,

Bill

Bob if matching looks isn't important, I recommend the
tried-and-true Astron series. I use an RS-20 just
fine on mine, you may want to go a little heavier with
the RS-35, and maybe get the metered version.

The Astrons are easy and cheap (relatively) to fix.

# 1391. 850 Frequency Drift...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-27 22:19:34 UTC
From: Joe
Topic: 1391  Message: 1391

Hello' all "Groupers" :-)...

Here's Joe, IW7ECJ asking for help...

I've been on this group for a while now, and have learnt A LOT from all the great brains over there...

Now I need some help about something that I can't find discussed in any thread on the Group:

I have an 850 that I have recently bought second-hand... its serial is in the 4XXXXXX range...

Everything seems to be fine, apart for a small quirk...

I mostly SWL in SSB with this rig and When I switch it on from cold, I have to tune some 200-250 Hz below the real frequency to hear natural-sounding stations...

I mean, if the station is transmitting on 28,000.00 KHz, I have to tune in 27,999.75 KHz, if I want tp hear correct audio...

So it seems that my Ref. Oscillator is off a bit, and this would be easy to fix (TC-5, right?)

Problem is that, after some 30Min. in Receive mode, the 850 drifts a bit, and makes the frequency readout almost exactly on-the-spot...

I mean, stations transmitting on 28,000,00 are correctly tuned at 28,999,98 (I mostly listen on 10m because of antenna restrictions...)

Leaving the radio on for longer periods doesn't yeld to larger drift, and the radio stays on the spot...

No TCXO on this radio, of course...

Does anybody have any idea on what to do to fix this?

Any suggestion will be greatly appreciated...

Thanks in advance for your time, OMs...

73 de Joe

# 1394. What PS?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-28 04:11:11 UTC
From: D.Cy Gacuzana
Topic: 1394  Message: 1394

I got a used RM-35, fair price off the Internet. All I had to do to make it perfect was tape the top of one of the meter casing together where it seperated from the lense part. Internal.

At this juncture, my opinion is, if it's within budget, just get an RS or RM 35, for ANY 100W radio.
It's big, it's heavy, it's old fasioned-reliable-non switching. I set it on the floor where it belongs, have had it on mostly 24/7 except the week I went out of town, ever since March this year, no protest from it or hint of falter whatsoever, and I got mine used on eBay of all places. Moving into the beginning of Winter, it also doubles as a foot rest, and keeps my bare feet nice and toasty. In the summer on days when it's in the 80s at the operating position, I have a cheap, yard-sale variety half-sized Vortex clone fan behind it and turn it on low blowing onto the heat sink. The RM-35 then, still doubles as a foot rest, while the Vortex clone keeps my feet nice and cool. I often have to nudge a cat off the -35 in the cooler/cold months, but I don't worry about the cat fur much either. One day I'll remove the cover, probably in the Spring, and take a vacuum to it, but it's not something that overly concerns me. Astron makes excellent power supplies, built to load and built to last.

# 1395. 450S - ALC and audio volume conflict

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-28 04:57:09 UTC
From: k9zy
Topic: 1395  Message: 1395

I've got some experience with the Kenwood TS-430S and good audio quality with readings just outside the ALC upper limit, but now I'm finding with my recently acquired TS-450S that I'm getting low audio reports even when my ALC reading is well beyond the upper limit. Reports of an S9 signal, but low audio.

I've tested with the stock MC-43 mic, and find the same scenario with my Realistic desktop mic. I have to set the Mic gain at 80 to 100% rotation position (distortion only reported when I got to 95%), and ALC readings pegged well above the upper limit recommended reading. (Just about the same with Speech processor on, but distortion comes in slightly earlier, but I'm well beyond recommended ALC readings). Is this consistent to 450s or should I be looking at a possible problem and not ignore the ALC reading? I worries me that I'm running at nearly full mic gain just to bring the audio up.
Thanks,
Mark

# 1396. Re: [TS-850_450_690] What PS?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-28 13:44:16 UTC
From: Bill
Topic: 1394  Message: 1396

Be careful cleaning the Astron, something might break,
hi!

I install a 3 amp diode backwards across the E-C
junction of the pass transistors, so that if I hook my
Astron to a marine battery, it won't blow the pass
transistors. The RS-20s already have the diode, and I
think the newer 35's do also.

I also make sure that the grounds are clean inside;
there is a black wire from the PC board to the
chassis, just make sure that connection is clean and
tight.

You can also add a G.E. MOV varistor, A 130LA10 or
130LA20 can go across the AC line, just after the
fuse; this will absorb any shocks to the system coming
from the AC line.

I am going to add some banana binding posts to the
FRONT of my Astron, to make it easier to hook up
transient or guest radios.

Stock the pass transistors and a LM723 regulator (DIP
version). Also see which SCR yours is using; this can
also take a shot and go shorted. If you keep these
items on hand, you can fix your own PS and save dozens
of dolares (usd)

Bill

Here are some things I do to mine to make 'em better.

Let's shoot for 0000Z tonight; 6PM PAC, 9PM EST ok?

7295 and down till we find clear freq. I will call
"CQ TS-850 GROUP" or something like that.

Callsign K0ZL, will be running 500 watts and omni ant.

Any replies to this, sign your callsign if it's not in
your email addy so I will be looking for you.

# 1402. INFORMAL NET MEETING 40M

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-28 16:15:30 UTC
From: Bill
Topic: 1402  Message: 1402

We are going to try an informal "net" meeting tonight (Tues 10/28) at 0200Z (6PM PST, 9PM EST) on 40M LSB, listen from 7295 and down until a somewhat clear frequency is reached. We will not interfere with existing nets or QSOs so please be flexible. Listen for "CQ TS-850 GROUP" or frequent references to the TS-850/450/690/570 radios. I will be announcing my callsign often, K0ZL.

My previous post was in error on the Zulu time, let's make it 0200Z Wednesday, that's 6PM Tues for the Left coast, and 9PM Tues nite for the Right coast. That gives everyone time to get dinner, kiss the wife and pet the dog or cat, and for propagation to go nationwide on 40.

73 all, hope to see you on tonight, God willin and and amp don't fry!

Bill K0ZL

They look like something really neat to have but $450 is a lot of money.
You got yourself quite a deal!

I think when I get my income tax refund next year I'll get the IRC 400 Hz
CW filters first.

# 1421. Re: 850 Frequency Drift...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-28 22:05:21 UTC
From: Joe
Topic: 1391  Message: 1421

Hello' Bill... thanks a lot for you reply...

18Hz drift from cold start is very good, IMHO, and I wish I had the same :-(

So, If I have indeed a bad Crystal, what can I do?

Does any body know what kind of Xtal is?
Is it a Xtal, or an oscillator?
Any Kenwood P/N for this component? Is it replaceable with something else NOT from Kenwood?
The TCXO is hard to find, not to mention the price, but is there any viable alternative to the original unit? Or is there anybody selling the TCXO?

Also, I remember reading something about someone using industrial TCXO for this purpose... any info?

Also, out of curiosity, does the TCXO option sit beside the original oscillator, or the TCXO replaces it?

Sorry for the fire of questions, but I would like to get somenthing to fix my rig...

Thanks everybody... thanks Bill!

On eBay you will pay slightly more than what the highest bidder thinks it's worth! Economics at it's most basic level, as long as you don't get in a bidding war and do something dumb...

I have got some great deals on ebay, and others have bought some great deals from me.

So sorry fellas...

I came home after a very bad day at work
(waaaahHHHHHHhhhh!) and went to bed... woke up, felt
like mule poo, and forgot to get on... so sorry.

Let's try again for Thurs nite, same freqs and time...
I think someone else had another freq to try, I can
scan them both.

73 all and again, my apologies.

Hi Joe,

the crystal is L77-0963-05, or replace it with the SO2 option.

I've gotten some great deals on eBay myself. And a few parts that were overpriced but very diffuicult to get. I've noticed that microwave power FET's with data sheets available for download on the Web go for quite a bit of money; those without data sheets available go for next to nothing.

Another place to watch for things like the DSP-100 is the eham.net "for sale" pages. Things are a lot more reasonably priced there.

# 1428. Background Noise?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-29 14:48:17 UTC
From: Bob Snelgrove
Topic: 1428  Message: 1428

Hi Gang

Got my 850 a few days ago and am enjoying it. This is my first real radio and my previous experience is scanners. I'm used to using the squelch on the scanner to have silence until there is a signal. I can't seem to do that on SSB. Is the background (whoosh) just something you have to learn to get used to when no one is talking?

I am only using a discone scanner antenna for now but am very impressed how well it's pulling in 40 meters.

I have the AIP "on" and both 2.7k filters on, RF gain all the way up.

Any suggestions much appreciated. A great rig!

thx

bob

# 1429. RE: [TS-850_450_690] Background Noise?

Yahoo group: TS-850_450_690 (2001 — 2005)

Bob,
Yes and no, the background can be squelched by using the squelch and RF gain but many stations you would normally hear will not be herd. Most HF operators learn not to even hear the background noise. Working the RF gain, Slope Tune, notch filters, and noise blankers is how you make the TS-850 come alive. Pulling that station you want out of all the rest is what it is all about.

International Radio. Some people call them IRC filters and some call them INRAD filters. Although the Kenwood filters are very good, IRC has a reputation for even better filters.

Bob you are doing well to leave the AIP ON (that is, preamps OFF) when on 40m; I am surprised though that you DON'T seem to need the preamp with a compromise antenna, to receive 40M!

Squelch does not work well on SSB, that is true, unless the station is well above the noise. A wire antenna will fix that. You got trees?

Try 20m, around 14.170, and 6Khz filters! tune guys in, then kick the 2.7's out.. see what you think.

Oh yeah, should put nice external speaker on that rig... got a spare boom-box speaker? They work great!

Randy is right!

God gave you a wet processor that is a real good noise
reduction system. I prefer it over the NR systems in
any of the new rigs.

Thing is to get the XYL and kids used to the noise!
Mine call me the "STATIC JUNKIE" sometimes!

Bill, all. I'm on the road, and missing my rigs. Missed tonights
contact. Let me try to link up on the weekend with an advance phone
call to you, Bill. FYI... I'm a displaced 9 out in Northern
California near Sacramento. Thanks Bill.

Yes, aip light is on. I tried my metal box motorola speaker but it
emphasizes the highs too much.

Can't get anything on 20 meters today (solar storm?)

thx

# 1439. Re: [TS-850_450_690] TS-870 vs. TS-850 ?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-29 17:10:09 UTC
From: Zack Widup
Topic: 1362  Message: 1439

People have recommended to me the 2.1 kHz filters for all-around SSB operating. If you're into contesting or DX pileups you may want the 1.8 kHz filters. Make sure you get both the 8.83 MHz and 455 kHz filters.

I've been told to get the 400 Hz filters for CW. That's what I plan on doing, as I do far more CW operating than SSB.

See http://www.qth.com/inrad/TS-850.HTM

Solar flux is great, but an A of 20 and K of 6 means
that 21 mhz and down are going to have trouble.

Try 10m... listen at 28.200 for CW beacons (wide
bandwidth, AIP OFF.

The motorola boxes are great for voice, suck for music
and general SWLing

What is the proper sequence, procedure, etc. to use
when using RF gain,
Slope Tune, notch filters, and noise blankers to
reduce the noise and pull the signal out.

# 1442. RE: [TS-850_450_690] Background Noise?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-29 21:11:00 UTC
From: Bill
Topic: 1428  Message: 1442

Experimentation is the key.

Conditions determine which you use, and when, also how your noggin feels... your settings will be different if you are overcoming a head cold, vs. Field Day for instance.

Generally I reduce my RF gain until the noise becomes tolerable; I run mine about 3 oclock or less usually. This also allows your filters to work better, as it puts the stronger, off-freq sigs a little further down the slope of the filters.

Noise blanker 1 only useful on ign and some line noise, typically on 10-15 meters. I never use it on the lower bands but very infrequently on 20. Always use the lowest (furthest CCW) setting on the noise blanker as it tends to widen strong off-channel sigs... this INCREASES noise rather than decreasing it!

Slope tuning can be used to reduce off-freq QRM but that is sometimes a trade off, as you can also loose part of the sig you are trying to copy. Remember also, as soon as you engage slope tuning, you are loosing some of the slope factor on the dual filter situation. You may notice if you have the two CW filters, if you engage slope tuning, QRM from the opposite side may actually get worse.

On the other hand, if I am running both CW filters, I tend to run my slope tuning two notches t'wards center on both sides; this broadens the response a little bit and I can copy code a bit faster that way. Also RTTY seems to decode a little better that way.

Bill and Bob,

The stock noise blankers on my 850 never seem to help. My 850 is older vintage (purchased in feb 91, ser # 20800013). Is the mod that cuts a couple of traces on the nb board worth doing?

Subject: RE: [TS-850_450_690] Background Noise?

Experimentation is the key.

Conditions determine which you use, and when, also how your noggin feels... your settings will be different if you are overcoming a head cold, vs. Field Day for instance.

Generally I reduce my RF gain until the noise becomes tolerable; I run mine about 3 oclock or less usually. This also allows your filters to work better, as it puts the stronger, off-freq sigs a little further down the slope of the filters.

Noise blanker 1 only useful on ign and some line noise, typically on 10-15 meters. I never use it on the lower bands but very infrequently on 20. Always use the lowest (furthest CCW) setting on the noise blanker as it tends to widen strong off-channel sigs... this INCREASES noise rather than decreasing it!

Slope tuning can be used to reduce off-freq QRM but that is sometimes a trade off, as you can also loose part of the sig you are trying to copy. Remember also, as soon as you engage slope tuning, you are loosing some of the slope factor on the dual filter situation. You may notice if you have the two CW filters, if you engage slope tuning, QRM from the opposite side may actually get worse.

On the other hand, if I am running both CW filters, I tend to run my slope tuning two notches t'wards center on both sides; this broadens the response a little bit and I can copy code a bit faster that way. Also RTTY

seems to decode a little better that way.

# 1444. Re: [TS-850_450_690] TS-870 vs. TS-850 ?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-29 20:26:21 UTC
From: Bruce Muscolino
Topic: 1362  Message: 1444

The TS-850 is limited to one set of filters for each mode. That is you can have 8.83 mHz ad 455 kHz filters for each SSB and CW, but you cannot also have the filter set for 2.1 kHz SSB.

I have the Kenwood 500 hZ filters for CW. I find them entirely adequate for my 100% CW operation. I don't think the 100 hZ narrower bandwidth if the IRC filters makes all that much difference in pure bandwidth. Where they may be better, and I haven't tried them yet, is in shape factor. And there the shape factor may play a more important role at 8.83 mHz than at both.

Hi again Bill...

So it is a "normal" crystal???

Any info on sources for this item?

A search on google yeld no useable result...

Also, please, can you (...or anybody else reading this) tell me where
I can find, on the internet a complete service manual, or at least
the circuit portion that contains the master oscillator?

Before ordering a crystal (given that I can find one...), I would
like to the circuit to see if there is something else that can cause
so big a drift...

Thanks for your patience, Bill and all list...

73 de Joe IW7ECJ

OK Joe tell us again, where does it start out, and
where does it end up? Please give frequency readout
to the nearest tens of hertz.

Also how are you determining zero beat?

# 1447. TS-850 "Fine" Tuning?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-30 07:10:12 UTC
From: Bob Snelgrove
Topic: 1428  Message: 1447

Hi Guys

I don't think my "fine" function is working. I push the button and hear the beep, the "fine" lights up in the display but the VFO doesn't change the freq. any slower than when it's not engaged. Could I have missed something?

thx

bob

# 1448. Re: 850 Frequency Drift...

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-30 08:35:17 UTC
From: Joe
Topic: 1391  Message: 1448

Hi Bill, Hi all reading this...

Sorry to bore you all with this problem of mine, but this
Group has proven to be a great source of knowledge, and I
really don't know where else I can place my questions...

So, again, a BIG "Thank You!!!" for undergoing the pain to
read my messages and, eventually, replying them...

OK... to summarize...

I have an 850 that has serial in the 4XXXXXX range that
I use mostly to SWL in SSB on 10mt due to aerial restrictions

When I switch it on from cold (Room Temp... 24 C),
I have to tune some 250 Hz below the real frequency to hear
natural-sounding stations...

I've made some tests last night with a friend transmitting QRP
on 28,000.00 KHz, and I had to tune in 27,999.75 KHz, to hear
his voice sound natural enough. RIT/XIT were OFF.

I also compared the audio to a new IC706MKII-G I have recently
acquired, and result was consistently the same: 250 Hz BELOW
desired QRG. Not to tell that the Icom is on-the-spot, but it
seems to me to be working fine.

After some 30Min. in Receive mode, the 850 drifts quite a
bit, and makes the frequency readout almost exactly on-the-spot...

I have no Frequency Counter here to check the Master Oscillator, and
I can rely only on what I listen on the air...

Also, I have tried many times to tune-in WWWV on 10 MHz or 15 MHz,
but haven't had any luck so far, because on those frequencies I
ALWAYS have the Chinese station "BPM", whose transmitting schedule
is unknown to me...

I'm not that picky about my QRG being EXACTLY on the spot... after
all I don't plan any MARS/CAP affiliation ;-)

It would suffice to me to have limited drift and reasonably
natural-sounding voices when tuning on their (supposed) QRG

OK... hope that this description is accurate enough to give you
something to work-on.

Thanks for your time Bill...

# 1449. Re: [TS-850_450_690] Background Noise?

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-30 15:06:12 UTC
From: Bill
Topic: 1428  Message: 1449

Ken I have done a few of these, can't really tell
without some objective testing. I haven't been driven
to try it on mine until I get into the rig for
something else, but my NB works pretty well. NB2 is
designed for the over-the-horizon radar pulses that we
used to call "the wood pecker", which has been shut
down in favor of satellite surveillance (thanks to God
and glasnost for that!).

I think the mod would be worth doing for you. As long
as you are in there, you can remove the DC-DC
converter and install a 11 pin DIP socket for that
board.

If you feel you don't want to tackle this, you can
mail me just the board and I can do it for you.

Hi Guys,

Does anyone have a picture of this or the inside of the 850?

Does it take a special too for those 8 or 9 little screws?

thx

bob

I really think you have a bad master osc crystal, as I
described below.. I would change it, or put in the
so-2 option.

Agreed, I just checked mine, no effect, fine and norm
is different tuning rates.

Suggest master reset...

Bill, The nb mod has been installed. I didn't do the dc-dc dip socket mod however. Didn't have any parts.

Preliminary results on the nb mod are very encouraging. Today on 20 m I had an s-9 noise level. When the nb was turned on the noise level dropped to s-3. Also, I did not notice any distortion on received ssb signals.

Bob, D11 is about the only "normal" (non-SMD) diode on
the board... and you just need a #2 Phillips for the
case screws and front panel swivel screws, and a #1
for the board screws.

remember to work barefoot.

I will get picture to the group and to Mods.dk as soon
as I get my beast open again.

From: w9goc
Topic: 1391  Message: 1464

Joe,
Since you mentioned having an Icom 706 available to you, can you use the Icom as a substitute for a frequency counter?

A short length of coax with a sniffer loop placed near the XTAL should be able to show you if the crystal is drifting in frequency, without introducing a significant load on the circuit.

I don't know what resources your local radio club has over there, but you may find that a club member DOES have a frequency counter you could borrow for an hour or so to confirm Bill's diagnosis before you try to source a replacement crystal.

Just a thought,

Frederick/W9GOC

Asunto: [TS-850_450_690] Background Noise?

Bill, The nb mod has been installed. I didn't do the dc-dc dip socket mod however. Didn't have any parts.

Preliminary results on the nb mod are very encouraging. Today on 20 m I had an s-9 noise level. When the nb was turned on the noise level dropped to s-3. Also, I did not notice any distortion on received ssb signals.

73 de Ken - K5GUU

# 1469. Thurs on-air meet

Yahoo group: TS-850_450_690 (2001 — 2005)
Date: 2003-10-31 13:45:55 UTC
From: Bill
Topic: 1469  Message: 1469

Went pretty well! 9 checkins including yers truly. Half were not aware of the group. Had TS850 times two, TS-690S, IC-746 PRO, FT-100D mobile in SOCAL, IC-756PRO and forget what JD was runnin.

Here's the kicker: Al, K5JLB checked in with his legendary Collins "Gold Dust Twins"... a KWS1 and 75A4 that was one of only three that belonged to Art Collins. Talk about a fine sounding transmitter! Barefoot at nearly 1000 watts! I guess QRP really is a state of mind isn't it. But Al sounded great and it was a real pleasure to hear that rare transmitter on the air.

As expected, 40M was perfectly clear up until meeting time. Turns out there is a "trivia net" on 7294 at 0200Z! So we had to move up to 7297.5. That worked real well, but there is a bunch of guys that meet on 7298 around 0200 that have been there for years.

I don't want to interfere with ongoing groups or nets, so what we will do is meet earlier, at 7297.5 around 0100-0130Z. Lets try that next Tuesday and see what happens.

Anyone want to spearhead another band/meeting? 17M might be a good choice and that would give me good excuse to get an antenna up.

Thanks to all who checked in, and to those who missed out.. ya missed out! But there's always next week! We will also have activity nights or weekend/holiday activity days, announced on short notice... those are fun!

73 all!

Bill K0ZL

Hi Frederick,

Thank you for your suggestions... The idea of using the 706 as a
Frequency counter may well work... I'm gonna try as soon as I get a
couple hours free...

For the second suggestion... Sorry, No local Radio Club here... And no
fellow HAM with a Frequency Counter :-(

Thanks again!

OK on the M54581P DRIVER ic for the relays on the filter unit, The
sub for this is LB1745, from East Coast or Pacific Coast parts, about
7-8 bucks. I am going to order some, if anyone wants me to add to
the order let me know.

73,

Bill K0ZL

Hi Gang

I love this 850 but it's really big for my limited space. I had thought about a 570 before this 850 came up on ebay.

Would a 570 be a real step backwards or is it a decent rig?

thx

bob

Keep eye out for TS-450 or TS-690, that last will give
you 6M.

The 570 is a fine rig, have not heard of any problems
with it yet. I think there is a 570 group on yahoo.

Thanks, Bill

That 690 looks exactly like a 450. Is the 6m the only diff?

thx

# 1482. Kenwood TS-850V/AT on ebay

Yahoo group: TS-850_450_690 (2001 — 2005)

I was looking around ebay today and searched for QRP items. The higest priced QRP item right now is a Kenwood TS-850V/AT. Says that the power output is limited to 10 watts and that it was made just for Japan. Why would a rig like this be made when you can just turn down the power on a TS-850 to make it 10 watts or less?

Topic: 1482  Message: 1483

More efficient to not have the finals in there sucking
600mA of bias current in TX; also perhaps legal
requirements of the license class.

That would drop the quiescent current draw in SSB
transmit from 2.2 amps to 1.6, big savings if you are
on solar power or batts.

That would be a primo QRP radio by the way.

Hi Ken...

Thanks for your reply...

> +/- 10 ppm at 28mhz is +/- 280 hz

OK... this is easy... 10 parts per million sum-up to 280 Hz @ 28MHz...

But to what temp range is this referred?

I have my 850 drifting some 250Hz in the first 30 Minutes from power-up from cold... is this within specs?

It seems too much to me, and what other users say me on this group indicate that a 20-25 Hz drift from cold is the average...

Before going out and look for an expensive replacement for the xtal, I would like to understand a bit more.

Thanks a lot again

73 de Joe IW7ECJ

Easy question. 10ppm means 10 parts per million.

or 10 hz per megahertz.

As you go up in frequency, the percentage error range stays the same, but the error in hertz goes up.

if it's 10 hz at 1 megahertz, it's 20 hz at 2 megahertz.

or 300hz at 30 Mhz.

BUT.. and that's a big butt... That presumes that you are MULTIPLYING to get to 30 Mhz, as in the old days.

We don't multiply much anymore. Except in the case of the 850, hi!

Your 20mhz rock is multiplied by three to come up with 60Mhz...this is your REFERENCE frequency.

so if the base error is 10ppm, you are looking at 600 hz possible drift at 60Mhz, which will translate to 600 hz possible drift on any band at any time. Any mode also.

HOWEVER... experience has shown me that we should see much less than 100Hz drift over time on or about 20 meters (or wherever... I check mine against WWV at 5.00000000000 Mhz, and at 60 degrees F it starts out 18 hz low, then moves to within 2hz at warm up and stays there; acts very much like it has the SO2 but it doesn't.

If you would like, I can check to see if we can get a high-stability rock from ICM... it will not be cheap.

I think your best deal is to bite the bullet and buy the SO2.

bill
